Health Care Disparities Report

for Minnesota Health Care Programs

Table of Contents

- I. Executive Summary..... 5
- II. Introduction 12
- III. Statewide Difference between MHCP and Other Purchasers of Health Care Services 15
- IV. Measures with Specification Changes 16
 - i. Childhood Immunization Status (Combo 10)..... 16
- V. Measures with an Increase in MHCP Rate 18
 - i. **Moderate Increase** 18
 - Controlling High Blood Pressure 18
 - ii. **Small Increase**..... 20
 - Colorectal Cancer Screening 20
- VI. Measures with a Decrease in MHCP Rate..... 22
 - i. **Small Decrease** 22
 - Chlamydia Screening in Women 22
 - Depression Remission at Six Months..... 24
 - Appropriate Testing for Children with Upper Respiratory Infection (URI) 26
 - Breast Cancer Screening 28
 - ii. **Moderate Decrease**..... 30
 - Optimal Diabetes Care 30
 - Optimal Asthma Control – Adult Ages 18-50..... 32
 - iii. **Large Decrease** 34
 - Optimal Vascular Care 34
 - Optimal Asthma Control – Children Ages 5-17 36
- VII. Medical Group/Clinic Level Performance Results..... 38
- VIII. Examination of Statewide MHCP Rates by Race and Hispanic Ethnicity 58
- IX. Examination of Statewide MHCP Rates by DHS Region..... 70
- X. Conclusion..... 79
- XI. Acknowledgements..... 80
- XII. List of Medical Groups Reported 81
- XIII. Appendices..... 83
- XIV. Appendix 1: Data Sources and Data Collection 83
- XV. Appendix 2: Methods..... 85
- XVI. Appendix 3: Medical Group/Clinic Performance Rate Tables 90
- XVII. Appendix 4: Medical Group Performance Over Time (Three Years) 146
- XVIII. Appendix 5: Purchaser Performance Rate Differences..... 156
- XIX. Appendix 6: Glossary 208
- XX. Appendix 7: Measure Definitions 211
- XXI. Appendix 8: References 213

Executive Summary

The 2017 *Health Care Disparities Report for Minnesota Health Care Programs* provides health care performance rates for patients enrolled in the managed care component of these programs. Minnesota Health Care Programs (MHCP) includes Medical Assistance and MinnesotaCare, which are both funded by state and federal governments and administered by health plans.

The report also explores the differences in performance rates between patients enrolled in MHCP and patients enrolled in managed care programs of Other Purchasers (private insurance or Medicare managed care programs) at a statewide and medical group level. For six measures (Optimal Diabetes Care, Optimal Vascular Care, Depression Remission at Six Months, Optimal Asthma Control - Children Ages 5-17, Optimal Asthma Control - Adults Ages 18-50, and Colorectal Cancer Screening), it also compares these rates at the clinic level.

When compared with the overall population of Minnesota, patients enrolled in MHCP are of lower socioeconomic status and represent a disproportionate number of persons of color, American Indian or Alaskan Natives, persons with disabilities, and elderly adults. In addition, these patients often experience significant personal challenges that create barriers to receiving

appropriate health care. In many cases, the complexity of the health care system is a barrier to receiving optimal care. As a result, MHCP patients may not receive care that meets best practices as often as patients insured by Other Purchasers.¹²³

The Minnesota Department of Human Services (DHS) selected the following 11 measures for this report based on their relevance to patients enrolled in MHCP. The measures are listed in order in which they appear throughout the report.

- Childhood Immunization Status (Combo 10)*^
- Controlling High Blood Pressure*
- Colorectal Cancer Screening
- Chlamydia Screening in Women*
- Depression Remission at Six Months
- Appropriate Treatment for Children with Upper Respiratory Infection (URI)*
- Breast Cancer Screening*
- Optimal Diabetes Care
- Optimal Asthma Control – Adults Ages 18-50
- Optimal Vascular Care
- Optimal Asthma Control – Children Ages 5-17

*Healthcare Effectiveness Data and Information Set (HEDIS) measures

^Measure specification changes

Key Findings

- Two of the ten comparable MHCP statewide measures have improved since last year (Controlling High Blood Pressure and Colorectal Cancer Screening). These improvements were statistically significant (see **Table ES3**). Controlling High Blood Pressure had the largest gains in MHCP rates.
- Eight measures (Appropriate Treatment for Children with URI, Breast Cancer Screening, Chlamydia Screening in Women, Depression Remission at Six Months, Optimal Asthma Control – Adults, Optimal Asthma Control – Children, Optimal Diabetes Care, and Optimal Vascular Care) declined from last year; of these, only Chlamydia Screening in Women did not have a statistically significant decline.
- For five measures, the criteria for including patients in the measure denominator changed in 2017 (Colorectal Cancer Screening, Optimal Diabetes Care, Optimal Asthma Control – Adults, Optimal Asthma Control – Children, and Optimal Vascular Care). This change may have contributed to the change in statewide rates for these measures.

³ Snowden AM, Kunerth V, Carlson, AM, McRae JA, Vetta E. Addressing Health Care Disparities Using Public Reporting. American Journal of Medical Quality, July/August 2012: 275-281.

- Of the seven measures with three or more years of comparable data, three have improved over time (See **Table ES3**). All three increases were statistically significant.
 - Colorectal Cancer Screening (eight percentage point increase)
 - Appropriate Testing for Children with URI (six percentage point increase)
 - Controlling High Blood Pressure (two percentage point increase)
- The Appropriate Treatment for Children with URI measure continues to have the highest MHCP rate at 93 percent, followed by Controlling High Blood Pressure at 72 percent. The measure with the lowest MHCP rate was Depression Remission at Six Months at five percent.
- Nine of the 11 statewide performance rates for MHCP patients were significantly lower than for patients insured by Other Purchasers. Two measures – Appropriate Treatment for Children with URI and Chlamydia Screening in Women – showed a significantly higher performance rate for MHCP patients than Other Purchaser patients (see **Table ES4**).
- The largest gaps between MHCP and Other Purchaser patients occurred on four measures (see **Table ES4**), and Childhood Immunization Status – Combo 10 had the largest gap:
 - Childhood Immunization Status – Combo 10 (23 percentage points)
 - Breast Cancer Screening (20 percentage points)
 - Colorectal Cancer Screening (19 percentage points)
 - Optimal Vascular Care (19 percentage points)
- Statewide gaps in performance rates between MHCP and Other Purchasers have narrowed over time for six measures. Four of these changes were statistically significant (indicated by an asterisk):
 - Chlamydia Screening in Women (over nine years)*
 - Controlling High Blood Pressure (over three years)*
 - Optimal Asthma Control – Children Ages 5-17 (over three years)
 - Optimal Asthma Control – Adults Ages 18-50 (over three years)*
 - Optimal Diabetes Care (over two years)
 - Colorectal Cancer Screening (over seven years)*

- Differences exist between **racial groups** within the MHCP patient population for all five HEDIS measures (**Table ES1**).

Table ES1: Summary of Findings by Racial Group

Measures/Racial Group	American Indian or Alaskan Native	Asian or Pacific Islander or Native Hawaiian	Black or African American	Multi-Racial	White	Unknown
Appropriate Treatment for Children with Upper Respiratory Infection		↑	↑		↓	↑
Childhood Immunization Status (Combo 10)	↓	↑	↓			↑
Controlling High Blood Pressure	↓	↓	↓		↓	
Breast Cancer Screening	↓		↓		↑	
Chlamydia Screening for Women		↑	↑	↑	↓	

↑ = Above MHCP Statewide Average
 ↓ = Below MHCP Statewide Average
BLANK = Similar to MHCP Statewide Average

- American Indian or Alaskan Native patients had rates significantly below the MHCP statewide average for three measures.
 - Asian patients had rates significantly above the MHCP statewide average for three measures (Appropriate Treatment for Children with URI, Childhood Immunization Status and Chlamydia Screening for Women) and below average for one measure.
 - Black or African American patients had rates significantly below average for three measures and above average for two measures (Appropriate Treatment for Children with URI and Chlamydia Screening for Women).
 - White patients had above average rates for one measure (Breast Cancer Screening) and below average rates for three measures.
- Statistically significant differences exist between **Hispanic** and **Non-Hispanic** patients within the MHCP patient population for three of the five HEDIS measures (**Table ES2**).

Table ES2: Summary of Findings by Ethnic Group

Measures/Ethnic Group	Hispanic	Non-Hispanic	Unknown
Appropriate Treatment for Children with Upper Respiratory Infection			↑
Childhood Immunization Status (Combo 10)	↑	↓	↑
Controlling High Blood Pressure		↓	
Breast Cancer Screening	↑		↓
Chlamydia Screening in Women	↑		

↑ = Above MHCP Statewide Average
 ↓ = Below MHCP Statewide Average
BLANK = Similar to MHCP Statewide Average

- Hispanic patients had health care performance rates that were significantly higher than Non-Hispanic patients in three measures – Chlamydia Screening in Women, Breast Cancer Screening, and Childhood Immunization Status (Combo 10).
- Non-Hispanic patients did not have a performance rate significantly higher than the statewide MHCP rate in any measures.

- Differences exist between geographical regions for the MHCP patient population for all of the Direct Data Submission (DDS) measures.
 - **The Northwest region** had the lowest rate for four measures (Optimal Diabetes Care; Optimal Vascular Care; Optimal Asthma Control – Children Ages 5-17; and Optimal Asthma Control – Adults Ages 18-50) and these rates were significantly below the MHCP statewide rate. This region did not have the highest screening rate for any measures.
 - **The Northeast region** had the highest rate for two measures (Depression Remission at Six Months and Colorectal Cancer Screening) and these rates were significantly above the MHCP statewide rate. This region did not have the lowest rate for any measure.
 - **The Metro region** had the highest rate for three measures (Optimal Vascular Care; Optimal Asthma Control – Children Ages 5-17; and Optimal Asthma Control – Adults Ages 18-50). The rates for Optimal Vascular Care; Optimal Diabetes Care; Optimal Asthma Control – Children Ages 5-17; and Optimal Asthma Control – Adults Ages 18-50 were significantly above the MHCP statewide rate. This region had the lowest rate for Colorectal Cancer Screening, which was significantly below the MHCP statewide rate.
 - **The Southern region** had the lowest rate for one measure (Depression Remission at Six Months), which was significantly below the MHCP statewide rate. The rates for the Optimal Asthma Control – Adults Ages 18-50 and Colorectal Cancer Screening measures were significantly above the MHCP statewide rate. This region had the highest rate for one measure (Optimal Diabetes Care).

There was one measure that had measure specification changes: **Childhood Immunization Status (Combo 10)**. Due to these changes, no trending data is available.

Statewide Rate Comparisons to Previous Years

Table ES3 displays the MHCP statewide results for report year 2017 (2016 dates of service) and compares the 2017 report results to previous years. See the definitions listed below for measure categories.

- **Measure Specification Changes since 2016** – Measures in this category had specification changes in the previous year. Due to this, no trend data is available.
- **“Large Increase” and “Large Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was greater than five percentage points from 2016 to 2017.
- **“Moderate Increase” and “Moderate Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was greater than one percentage point and less than or equal to five percentage points from 2016 to 2017.
- **“Small Increase” and “Small Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was less than or equal to one percentage point from 2016 to 2017.

Table ES3: Summary of MHCP Statewide Rates for 2017 Report Year Compared to Previous Years

Quality Measure	2017 MHCP Statewide Average	MHCP Percentage Point Change Statewide (Report Year 2017-2016)	MHCP Percentage Point Change Over Time (Report Year 2017 to First Year Reported)
Measure Specification Changes since 2016			
Childhood Immunization Status (Combo 10)*	36.0%	N/A	N/A
Increase in MHCP Rate since 2016			
Moderate Increase			
Controlling High Blood Pressure*	72.2%	2.1**	2.6** (3 years)
Small Increase			
Colorectal Cancer Screening*▲	56.2%	0.6**	8.2** (7 years)
Decrease in MHCP Rate since 2016			
Small Decrease			
Chlamydia Screening in Women	55.7%	-0.3	-0.4 (9 years)
Depression Remission at Six Months	4.5%	-0.3**	-0.3** (2 years)
Appropriate Treatment for Children with URI	92.8%	-0.4**	6.4** (12 years)
Breast Cancer Screening	60.8%	-1.0**	-1.9** (4 years)
Moderate Decrease			
Optimal Diabetes Care*▲	32.5%	-1.1**	-1.1** (2 years)
Optimal Asthma Control - Adults Ages 18-50*▲	40.5%	-4.1**	-1.2** (3 years)
Large Decrease			
Optimal Vascular Care*▲	45.1%	-7.2**	-7.2** (2 years)
Optimal Asthma Control - Children Ages 5-17*▲	51.0%	-7.3**	-2.0** (3 years)

* These statewide averages are weighted samples (see methods). ** Statistically significant difference (p<0.05).

▲ The criteria for including patients in the measure denominator changed in 2017. This change may have contributed to the changes in statewide rates for these measures.

Summary of Statewide Purchaser Rate Differences

Table ES4 displays differences in the quality measures for patients enrolled in MHCP compared to patients enrolled with Other Purchasers. The difference in rates was calculated by subtracting the MHCP rate from the Other Purchasers rate. In the fourth column from the left, labeled “Rate Difference (2017) (Other purchasers-MHCP),” a positive number indicates the Other Purchasers rate was higher than the MHCP rate; therefore, Other Purchasers patients received were more likely to achieve that measure. Conversely, a negative number indicates the MHCP rate was higher than the Other Purchasers rate; therefore, MHCP patients were more likely to achieve that measure.

Table ES4: Summary of Statewide Purchaser Rate Differences

Quality Measure	2017 MHCP Statewide Average	2017 Other Purchasers Statewide Average	Rate Difference (2017) (Other Purchasers - MHCP)	Rate Difference (Current Year vs. First Year) Over time (Other Purchasers-MHCP)
Chlamydia Screening in Women [○]	57.0%	50.7%	-6.2%**	Gap Narrowed** (2009-2017)
Appropriate Treatment for Children with URI [○]	92.7%	90.1%	-2.6%**	Gap Widened** (2006-2017)
Depression Remission at Six Months	4.5%	8.6%	4.1%**	Gap Widened (2016-2017)
Controlling High Blood Pressure* [○]	72.4%	78.2%	5.8%**	Gap Narrowed** (2015-2017)
Optimal Asthma Control - Children Ages 5-17* [▲]	51.0%	61.1%	10.1%**	Gap Narrowed (2015-2017)
Optimal Asthma Control - Adults Ages 18-50* [▲]	40.5%	53.3%	12.8%**	Gap Narrowed** (2015-2017)
Optimal Diabetes Care* [▲]	32.5%	47.6%	15.1%**	Gap Widened (2016-2017)
Optimal Vascular Care* [▲]	45.1%	63.6%	18.5%**	Gap Widened** (2016-2017)
Colorectal Cancer Screening* [▲]	56.2%	74.7%	18.5%**	Gap Narrowed** (2011-2017)
Breast Cancer Screening [○]	63.0%	82.6%	19.6%**	Gap Widened** (2014-2017)
Childhood Immunization Status (Combo 10)* ^{▲○}	38.7%	61.2%	22.5%**	N/A

* These statewide averages are weighted samples (see methods). ** Statistically significant difference (p<0.05). ^Measure specification changes

▲The criteria for including patients in the measure denominator changed in 2017. This change may have contributed to the change in statewide rates for these measures.

○ Indicates medical group average. For HEDIS measures, the medical group average includes patients who are attributed to a medical group. Conversely, the statewide average includes all patients - those attributed to a medical group and those who are not.

Summary of Medical Group Performance Over Time

Table ES5 lists 14 medical groups with consistently high performance on two or more quality measures over three years of the seven quality measures that can be compared. It also lists 18 medical groups with consistent improvement on two or more quality measures over three years of the seven quality measures that can be compared.

Table ES5: Medical Groups with Consistently High Performance or Consistent Improvement

Introduction

A worthy goal for our national health care system is quality care for all patients. Despite that, significant evidence shows widespread disparities exist in health care across the country. Health care quality, cost and patient outcomes vary by factors such as where patients live, which doctors or clinics provide their health care, their socioeconomic status, and their race and ethnicity.

There is growing evidence that low-income patients face barriers to obtaining high-quality health care. In some cases, the barriers are actually increasing.⁴ An important aspect of improving accountability for health care outcomes is establishing a mechanism for ongoing measurement.

The *2017 Health Care Disparities Report for Minnesota Health Care Programs* is produced by MN Community Measurement (MNCM) in collaboration with the Minnesota Department of Human Services (DHS). It summarizes health care quality performance results of patients enrolled in Minnesota Health Care Programs (MHCP) and makes comparisons to the results of other patients.

The measures in this report are presented at statewide, medical group and, in some cases, clinic levels. This is the only public report that medical groups and clinics can use to identify health care performance rates for their patients enrolled in state-funded public programs, as well as compare those rates with other medical groups and clinics. All patients whose care is reviewed in this report are enrolled in managed care programs, either through MHCP or other payers.

Background

Due to the at-risk nature of the MHCP patient population, the Minnesota State Legislature directed DHS in 2005 to establish a performance reporting and quality improvement system for medical groups and clinics providing health care services to patients enrolled in the managed care component of MHCP. The inaugural *Health Care Disparities Report*, released in 2007, was the first in the nation to include local level information that was actionable for medical groups and clinics.

Before this report became available, national and state level reports of differences in care were either dismissed as being the result of patient factors and issues outside of medical group control, or because of the perception that disparities existed elsewhere. This report supplies comparable, transparent performance data to medical groups and clinics; which allows them to reflect on the disparities within their systems and identify areas for improvement.

Overview of Performance Measures

This report includes 11 health care quality performance measures selected by DHS based on their relevance to patients enrolled in MHCP. Six of the measures were developed by MN Community Measurement (MNCM); the other five were developed by the National Committee for Quality Assurance (NCQA) and are known as Healthcare Effectiveness Data and Information Set (HEDIS) measures. Most performance measures included in this report have been endorsed by the National Quality Forum (NQF) and are aligned with clinical guidelines. For more information on methods, see Appendix 2.

Additionally, the report features MHCP performance rates for HEDIS measures by race and Hispanic ethnicity using information self-reported by patients at the time of their MHCP enrollment. These results are reported at a statewide level. The results show differences in rates among MHCP patients by race and Hispanic ethnicity.

Future Commitment

DHS and MNCM are committed to analyzing MHCP health care performance rates at medical group and clinic levels to inspire improvement. We are pleased that this report continues to generate interest from the media, policymakers, and

⁴ Lavizzo-Mourey, R. (2008). Racial disparities in health care quality should mean equality. *Healthcare Financial Management*, January 2008: 102-104.

researchers. We are even more encouraged that the information is being used by health care stakeholders to improve care for vulnerable patients. Our mission is to accelerate the improvement of health by publicly reporting health care information. Our vision is to drive change that improves health, patient experience, cost and equity of care for everyone in our community.

For More Information

For additional information, please contact Anne Snowden at snowden@mncm.org or Mark Foresman at mark.foresman@state.mn.us.

Please see the next page.

Statewide Differences between MHCP and Other Purchasers of Health Care Services

This section presents rates for the 11 measures selected by DHS for this report. Measures with specification changes in 2017 are described first. Next, measures with trend data are organized into three sections based on the size of the change in results from last year's MHCP statewide rates. Each measure is briefly described and statewide results by purchaser are displayed for each year that the measure has been active. Additionally, trending results for MHCP and Other Purchasers are included.

Next, medical group performance rates for MHCP patients are highlighted, including lists of medical groups with the highest performance and medical groups that made the largest improvements since 2016. Additionally, clinic performance highlights are included for six measures: Optimal Diabetes Care, Optimal Vascular Care, Depression Remission at Six Months, Optimal Asthma Control - Children Ages 5-17, Optimal Asthma Control - Adults Ages 18-50, and Colorectal Cancer Screening.

Finally, medical group performance over time is reported with an analysis of medical group purchaser rate differences. **Please note** that the Childhood Immunization Status (Combo 10) measure is not included in this analysis due to measure specification changes in 2017.

Background

Please note that the significance level is defined as $p < 0.05$.

Detailed medical group performance data are presented in three appendices:

- Appendix 3: Clinic Level and Medical Group Performance Rate Tables
- Appendix 4: Medical Group Performance over Time (Three Years)
- Appendix 5: Purchaser Performance Rate Differences

Measure with Specification Changes from 2016 to 2017

Childhood Immunization Status (Combo 10)

Infants and toddlers are especially vulnerable to infectious diseases, due to their developing immune systems. Vaccines can help prevent many diseases and their serious side effects. Immunization of infants and toddlers is recommended by the American Academy of Pediatrics (AAP).

The Childhood Immunization Status (Combo 10) measure evaluates the percentage of children who had the following vaccines by their second birthday:

- Four DTaP
- Three IPV (polio)
- One MMR
- Three H influenza type B
- Three Hepatitis B
- One VZV (chicken pox)
- Four pneumococcal conjugate
- One hepatitis A
- Two or three rotavirus
- Two influenza

The data for this measure are collected from health plan claims, the Minnesota Immunization Information Connection (MIIC) registry and medical record review. (See Glossary)

For Childhood Immunization Status in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The MHCP statewide rate for childhood immunizations was 36 percent; the rate for Other Purchasers was 60 percent. **Table 1** displays statewide rates for each purchaser since measure implementation.

Table 1: Statewide Rates for Childhood Immunization Status (Combo 10)

Year	MHCP Rate	MHCP CI (U/L)*	MHCP Denominator (Patients Eligible)	Other Purchaser Rate	Difference (Other-MHCP)
2017	36.0%	34.3% - 37.6%	6,927	60.1%	24.1%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

** Denotes a statistically significant difference.

This measure has the largest purchaser gap of all 11 measures included in this report.

Please see the next page.

Moderate Increase in MHCP Rate from 2016 to 2017

Controlling High Blood Pressure

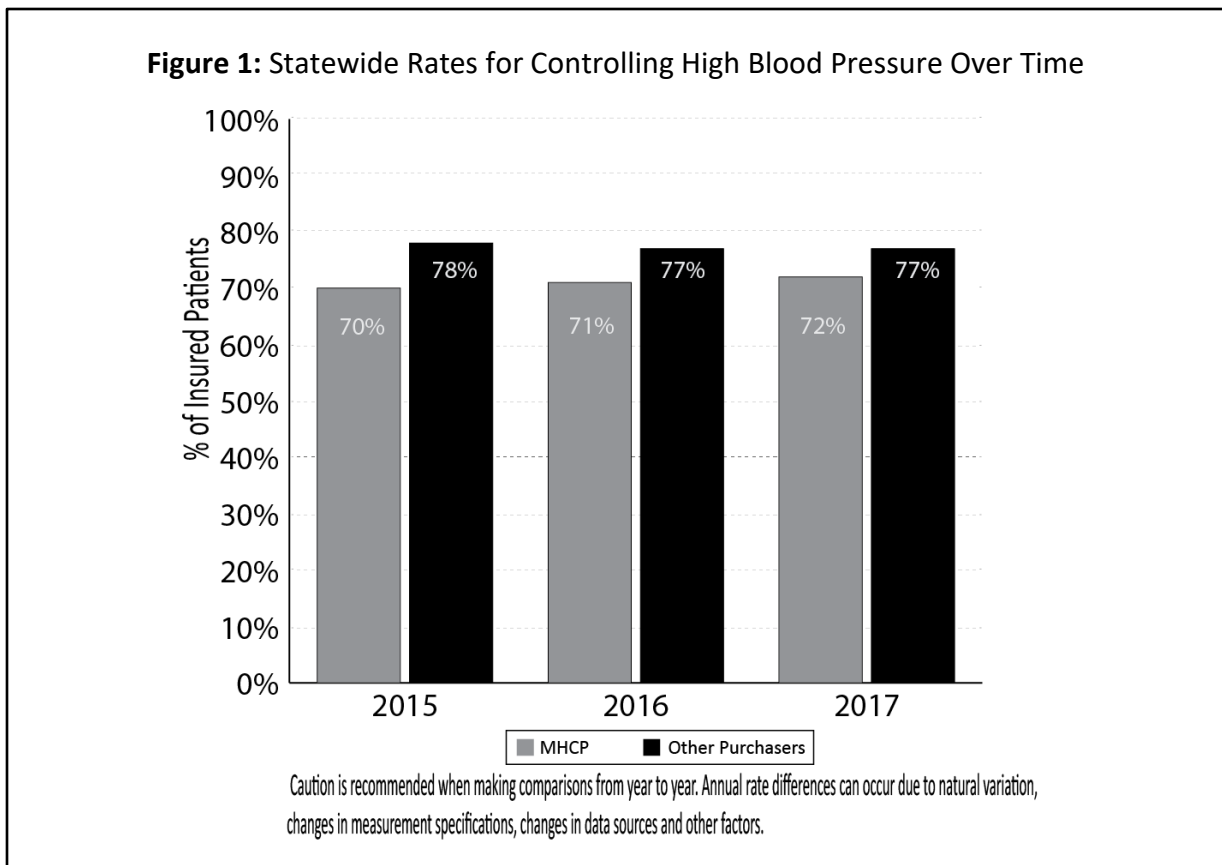

Hypertension, or high blood pressure, is associated with serious health effects, such as coronary heart disease, stroke, and retinopathy. Control of high blood pressure can substantially reduce the chance of complications and reduce the risk of developing other conditions.

The Controlling High Blood Pressure measure evaluates the percentage of patients between ages 18-85 with a diagnosis of hypertension whose blood pressure was adequately controlled at less than 140/90 mmHg during the measurement year. The representative blood pressure, as defined by the National Committee for Quality Assurance (NCQA), is the most recent blood pressure reading during the measurement year, as long as the reading occurred after the diagnosis of hypertension. Data collected for this measure are from health plan claims and medical record review (See Glossary).

The following are the criteria for being adequately controlled:

- Patients ages 18-59 whose blood pressure was <140/90 mm Hg.
- Patients ages 60-85 with a diagnosis of diabetes whose blood pressure was <140/90 mm Hg.
- Patients ages 60-85 without a diagnosis of diabetes whose blood pressure was <150/90 mm Hg.

From 2016 to 2017, the percentage of MHCP adult patients whose blood pressure was under control increased slightly from 71% to 72% and this increase was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 1** below for Controlling High Blood Pressure for MHCP and Other Purchasers over time.

Since 2015, the MHCP and Other Purchaser rates had similar increases each year; however, MHCP patients continue to have a significantly lower rate of Controlling High Blood Pressure than patients insured by Other Purchasers. The statewide rate for Controlling High Blood Pressure for MHCP patients was 72 percent; the rate for patients enrolled with Other Purchasers was 77 percent. **Table 2** displays statewide rates for each purchaser since measure implementation.

Table 2: Statewide Rates for Controlling High Blood Pressure

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator (Patients Eligible)	Other Purchaser Rate	Difference (Other-MHCP)
2017	72.2%	71.3% - 73.0%	9,871	77.3%	5.13%**
2016	70.1%	69.3% - 71.0%	11,415	76.1%	5.92%**
2015	69.6%	68.8% - 70.5%	11,465	77.7%	7.88%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

The difference between purchasers for Controlling High Blood Pressure decreased by almost one percentage point from 2016 to 2017, but this was not statistically significant.

Small Increase in MHCP Rate from 2016 to 2017

Colorectal Cancer Screening

July 1, 2016 - June 30, 2017 Dates of Service

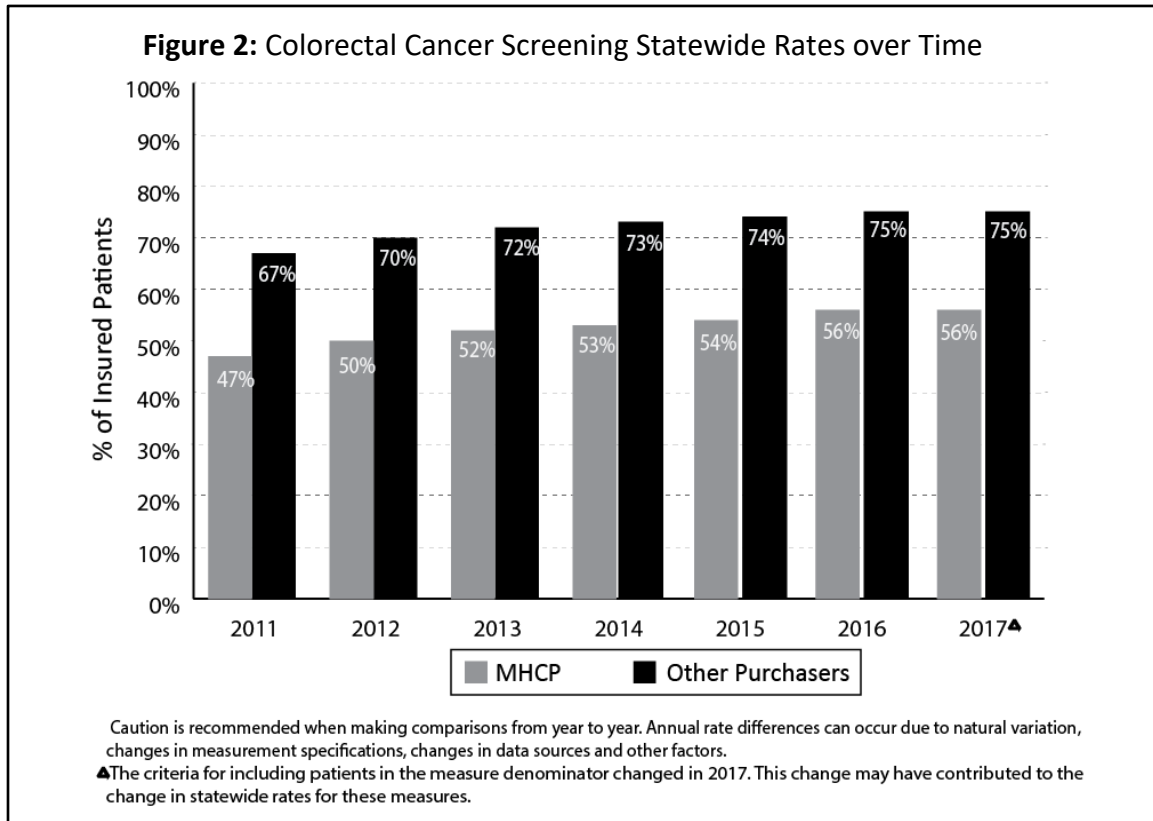

Of cancers that affect both men and women, colorectal cancer is the second leading cause of cancer-related deaths in the United States and the third most common cancer in men and women. Colorectal cancer affects men and women of all racial and ethnic groups and is found most often in people aged 50 years or older. Screening helps find colorectal cancer at an early state, when treatment often leads to a cure.

The Colorectal Cancer Screening measure evaluates the percentage of adults ages 51-75 who are up-to-date with the appropriate screenings for colorectal cancer. Appropriate screenings for colorectal cancer include:

- Guaiac-fecal occult blood test (gFOBT) or fecal immunochemical test (FIT) during the measurement year
- FIT-DNA test during the measurement year or the two years prior
- Flexible sigmoidoscopy during the measurement year or the four years prior
- CT colonography during the measurement year or the four years prior
- Colonoscopy during the measurement year or the nine years prior

Medical groups and clinics report data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the Colorectal Cancer Screening rate for MHCP patients increased by 0.6 percentage points. This increase was statistically significant. Since 2011, the rate for MHCP patients has increased by approximately nine percentage points, which is statistically significant. See **Figure 2** below for Colorectal Cancer Screening rates for MHCP and Other Purchasers over time.

Since 2011, the MHCP and Other Purchaser rates had similar increases each year; however, MHCP patients continue to have a significantly lower rate of Colorectal Cancer Screening than patients insured by Other Purchasers. The MHCP statewide rate for Colorectal Cancer Screening is 56 percent; the rate for Other Purchasers is 75 percent. **Table 3** displays statewide rates for each purchaser since measure implementation.

Table 3: Statewide Rates* for Colorectal Cancer Screening

Year	MHCP Rate	MHCP CI (U/L)*	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)**
2017	56.2%	55.9% - 56.5%	116,426	74.7%	18.5%***
2016	55.6%	55.3% - 55.9%	107,979	74.7%	19.1%**
2015	53.9%	53.6% - 54.2%	93,834	74.3%	20.4%***
2014	53.0%	52.7% - 53.4%	72,037	72.9%	19.6%***
2013	51.8%	51.4% - 52.2%	53,788	71.8%	20.0%***
2012	49.7%	49.3% - 50.2%	41,396	70.1%	20.4%***
2011	47.4%	46.9% - 47.9%	36,652	66.6%	19.1%***

*The statewide weighted rate includes all patients eligible for the measures who were reported directly to MNMCM by medical groups and clinics from electronic health records or paper-based medical charts.

**A confidence interval gives an estimated range of values calculated from a given sample of data. A 95% confidence interval implies a 95% level of confidence that the interval includes the true mean or parameter.

***Denotes a statistically significant difference.

The gap between purchasers has remained relatively consistent for all seven years that the data have been reported for this measure. Since 2011, the gap has narrowed slightly and significantly.

Small Decrease in MHCP Rate from 2016 to 2017

Chlamydia Screening in Women

Chlamydia is the most common sexually transmitted disease in the US and can lead to serious health problems, including infertility in women. Chlamydia most often has no symptoms, and if symptoms do appear, it may be several weeks after being infected. Screening for chlamydia is recommended by the US Preventive Services Task Force.

The Chlamydia Screening in Women measure evaluates the percentage of sexually active women ages 16-24 who had at least one test for chlamydia during the measurement year. The data for this measure are collected from health plan claims. (See Glossary)

In 2017, 56 percent of MHCP patients received appropriate chlamydia screening, which is a one percent decrease from 2016. This difference is statistically significant. See **Figure 3** for appropriate screening rates for MHCP and Other Purchasers over time.

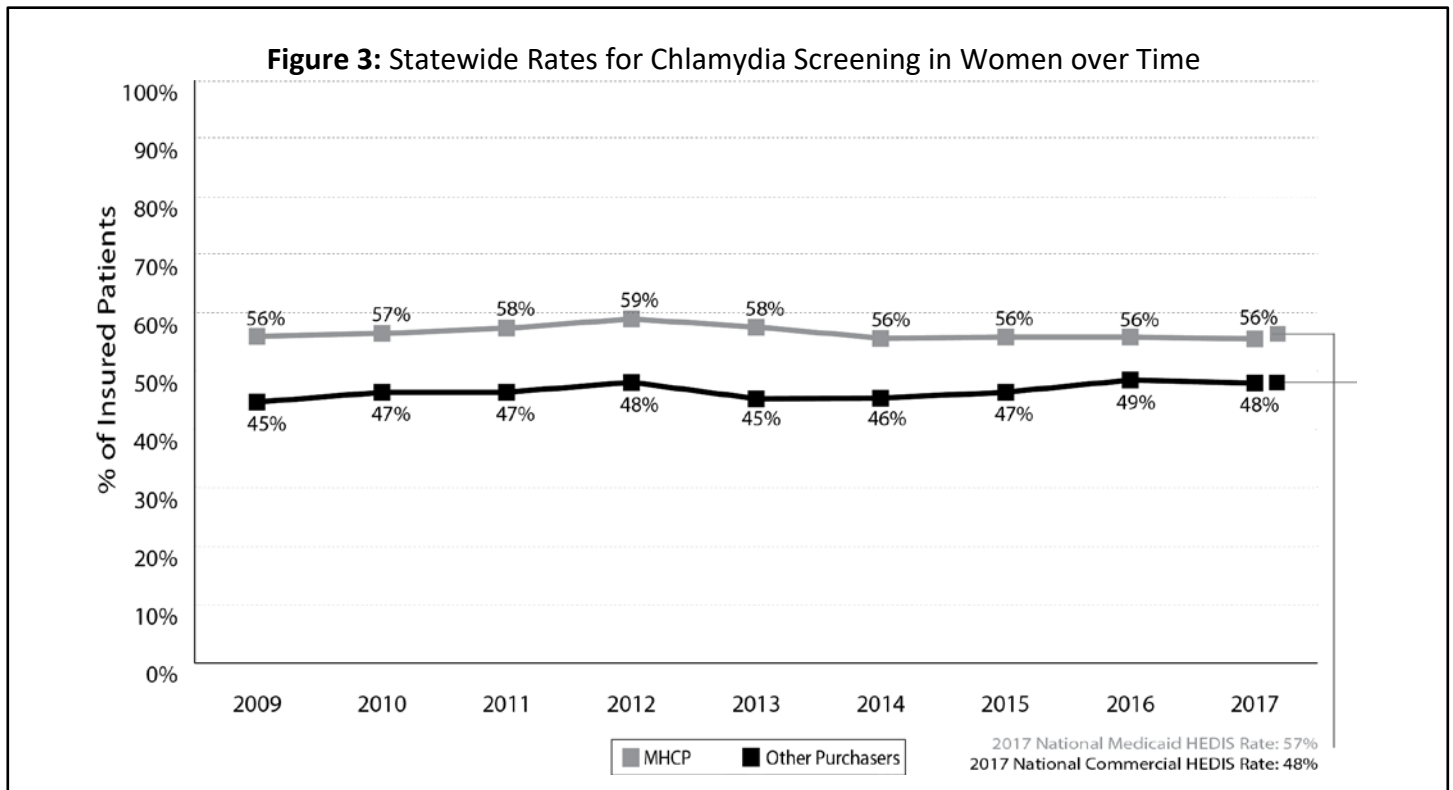

Figure 3 also includes the 2017 National HEDIS Medicaid and Commercial rates as benchmarks for comparison. The statewide MHCP rate is the slightly less than the 2017 National HEDIS benchmark (57 percent). The statewide Other Purchasers rate is above the 2017 National Commercial benchmark (48 percent).

MHCP patients continue to have a significantly higher rate of chlamydia screening than patients enrolled with Other Purchasers. The MHCP rate decreased slightly from 2016 to 2017, however, this difference was not significant. The Other Purchaser rate also decreased slightly from 2016 to 2017. The MHCP statewide rate for chlamydia screening was 56 percent; the rate for Other Purchasers was 48 percent. **Table 4** displays statewide rates for each purchaser since measure implementation.

Table 4: Statewide Rates for Chlamydia Screening in Women

Year	MHCP Rate	MHCP CI (U/L)*	MHCP Denominator	Other Purchaser Rate	Difference (Other-MHCP)
2017	55.7%	55.0% - 56.4%	18,443	48.1%	-7.60%**
2016	56.0%	55.4% - 56.6%	23,871	48.6%	-7.43%**
2015	56.0%	55.3% - 56.7%	20,199	46.5%	-9.56%**
2014	55.8%	54.9% - 56.6%	14,175	45.5%	-10.3%**
2013	57.7%	56.9% - 58.5%	13,905	45.4%	-12.3%**
2012	59.1%	58.3% - 59.9%	14,753	48.2%	-10.9%**
2011	57.5%	56.7% - 58.3%	15,614	46.5%	-11.0%**
2010	56.6%	55.8% - 57.4%	14,258	46.5%	-10.1%**
2009	56.1%	55.3% - 57.0%	12,155	44.8%	-11.3%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.
 ** Denotes a statistically significant difference.

For this measure, MHCP patients had a higher rate of appropriate care than Other Purchaser patients. While the difference between purchasers decreased since 2013, the MHCP statewide rate has consistently been higher than the Other Purchaser statewide rate for every year.

Depression Remission at Six Months

February 1, 2016 - January 31, 2017 Dates of Service

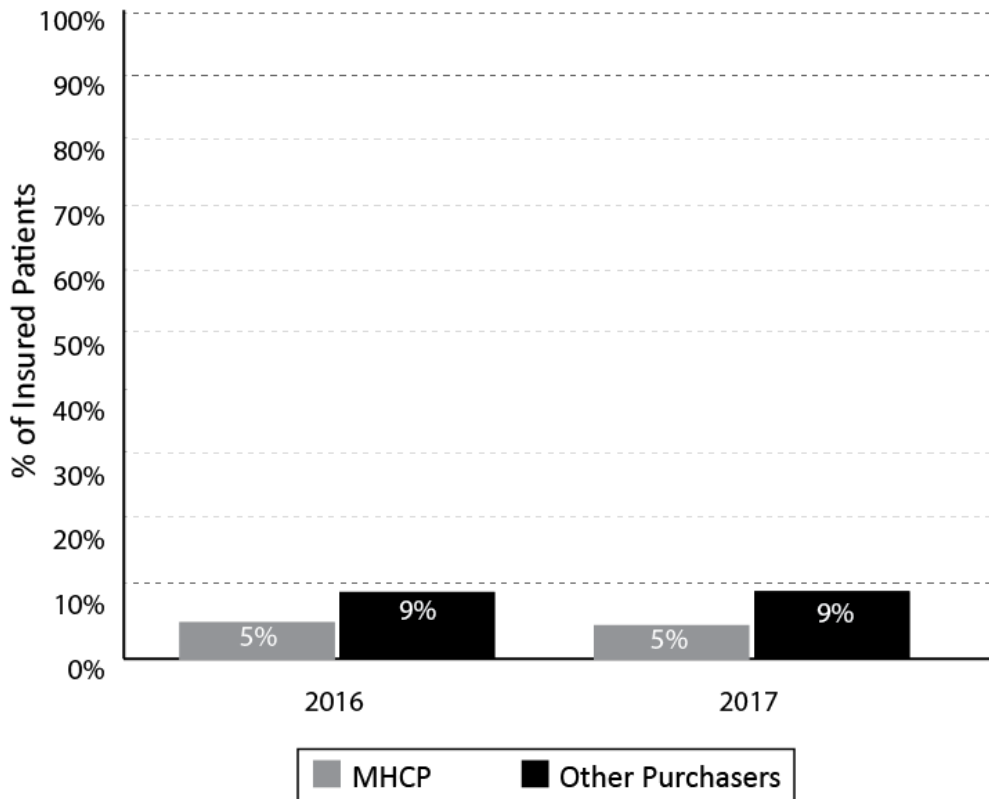

Depression is a serious mental illness and affects over five percent of adult Americans on any given day. Depression is commonly associated with difficulty with performing daily activities. Treatment can help improve the symptoms of depression.

The Depression Remission at Six Months measure evaluates the percentage of patients with a diagnosis of major depression or dysthymia and an initial Patient Health Questionnaire-9 (PHQ-9) score greater than nine who are in remission defined as a subsequent PHQ-9 score (after six months of treatment) less than five.

Medical groups and clinics report data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the percentage of MHCP patients whose depression was in remission at six months decreased by 0.3 percentage points and this was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 4** below for Depression Remission at Six Months for MHCP and Other Purchasers over time.

Figure 4: Statewide Rates for Depression Remission at Six Months Over Time

Caution is recommended when making comparisons from year to year. Annual rate differences can occur due to natural variation, changes in measurement specifications, changes in data sources and other factors.

For Depression Remission at Six Months in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The statewide rate for Depression Remission at Six Months for MHCP patients was five percent; the rate for patients enrolled with Other Purchasers was nine percent. **Table 5** displays the statewide rates for each purchaser since measure implementation.

Table 5: Statewide Rates for Depression Remission at Six Months

Year	MHCP Rate	MHCP CI (U/L)*	MHCP Denominator	Other Purchaser Rate	Difference (Other-MHCP)
2017	4.5%	4.3% - 4.8%	25,551	8.6%	4.1%**
2016	4.8%	4.6% - 5.1%	21,766	9.1%	4.3%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

Appropriate Treatment for Children with URI

Upper respiratory infections (URI), also known as the common cold, are caused by viruses and not bacteria. These infections do not require antibiotics for patients to feel better. Appropriate use of antibiotics are an important strategy in reducing the spread of antibiotic-resistance bacteria.

The Appropriate Treatment for Children with Upper Respiratory Infection (URI) measure evaluates the percentage of children ages three months to 18 years with a diagnosis of URI that were not given an antibiotic prescription within three days of the episode period. The episode occurred between July 1 of the prior year and June 30 of the measurement year. Appropriate treatment is to not provide an antibiotic, since most URIs are caused by a virus (antibiotics are not an appropriate treatment for a virus). A higher rate indicates better performance and appropriate treatment. Data collected for this measure are from health plan claims. (See Glossary)

In 2017, 93 percent of MHCP children with URI received appropriate treatment. This rate decreased by less than one percentage point from 2016, and that decrease was statistically significant. Since measure implementation, the rate for MHCP children has increased by approximately seven percentage points, which is also statistically significant. See **Figure 5** for statewide rates for MHCP and Other Purchasers over time for this measure.

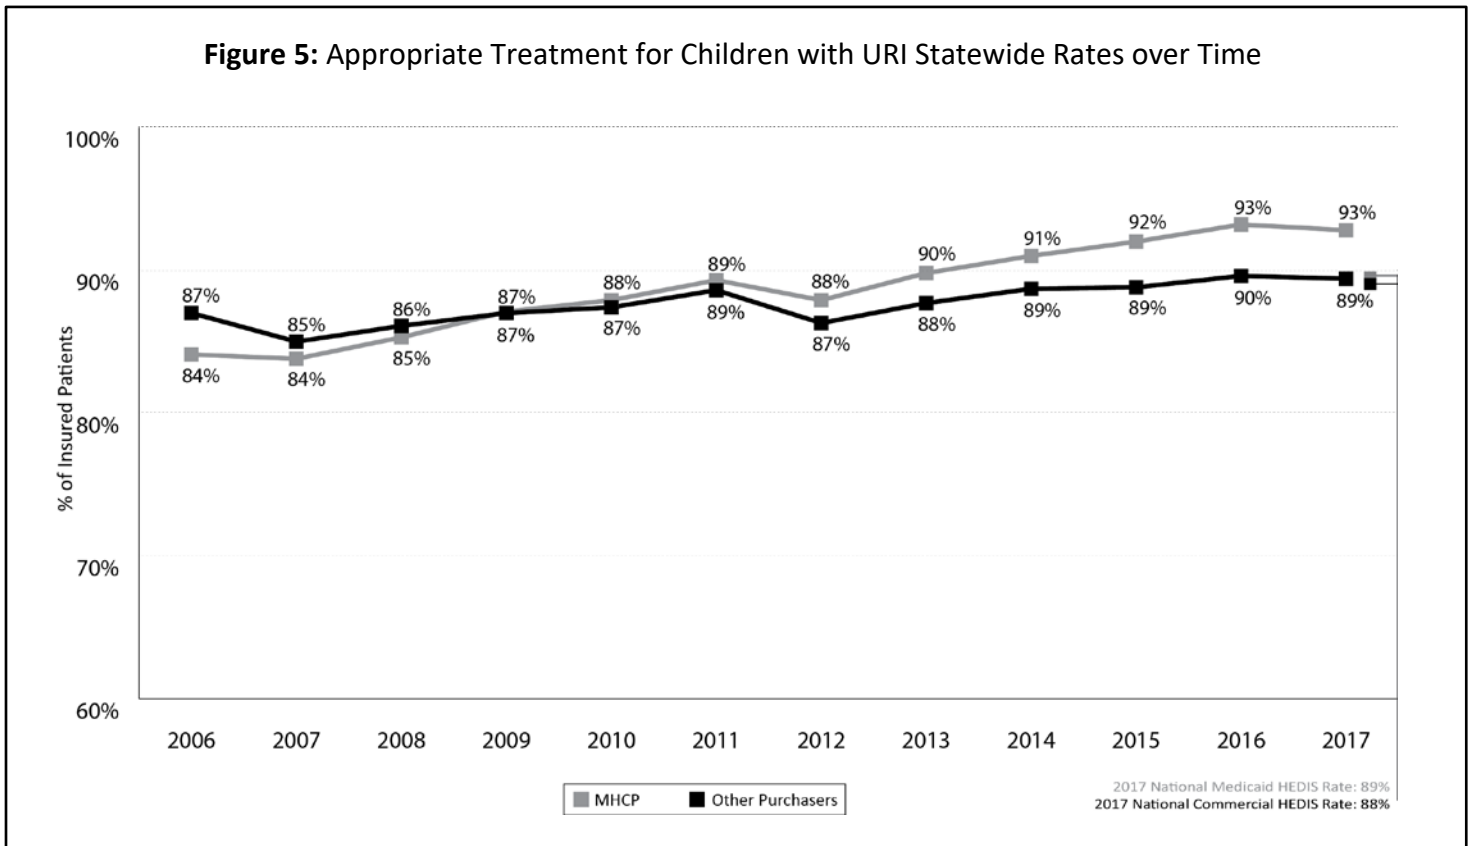

Figure 5 also displays the 2017 National HEDIS Medicaid and Commercial rates as benchmarks for comparison. The statewide MHCP and Other Purchasers rates are both above their respective National HEDIS benchmarks. In other words, Minnesota medical groups are more successful in achieving this health care best practice with their patients, regardless of purchaser, than other medical groups nationwide.

MHCP patients and patients insured by Other Purchasers continued to have similar rates for Appropriate Treatment for Children with URI, although the difference between them is statistically significant. The statewide MHCP rate for this measure was 93 percent; the rate for Other Purchasers was 89 percent. **Table 6** displays statewide rates for each purchaser since measure implementation.

Table 6: Statewide Rates for Appropriate Treatment for Children with URI

Year	MHCP Rate	MHCP CI (U/L)*	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)**
2017	92.8%	92.4% - 93.1%	18,978	89.4%	-3.4%**
2016	93.2%	92.9% - 93.5%	24,010	89.6%	-3.4%**
2015	92.0%	91.6% - 92.4%	17,606	88.8%	-3.2%**
2014	91.0%	90.5% - 91.3%	19,563	88.7%	-2.3%**
2013	89.8%	89.3% - 90.2%	18,331	87.7%	-2.1%**
2012	87.9%	87.6% - 88.2%	37,573	86.3%	-1.6%**
2011	89.3%	88.8% - 89.7%	20,722	88.6%	-0.7%**
2010	87.9%	87.4% - 88.3%	18,534	87.4%	-0.5%
2009	87.1%	86.6% - 87.6%	17,712	87.0%	-0.1%
2008	85.3%	84.8% - 85.8%	17,043	86.1%	0.8%**
2007	83.8%	83.3% - 84.2%	24,793	85.0%	1.2%**
2006	84.1%	83.5% - 84.7%	14,684	87.0%	2.9%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

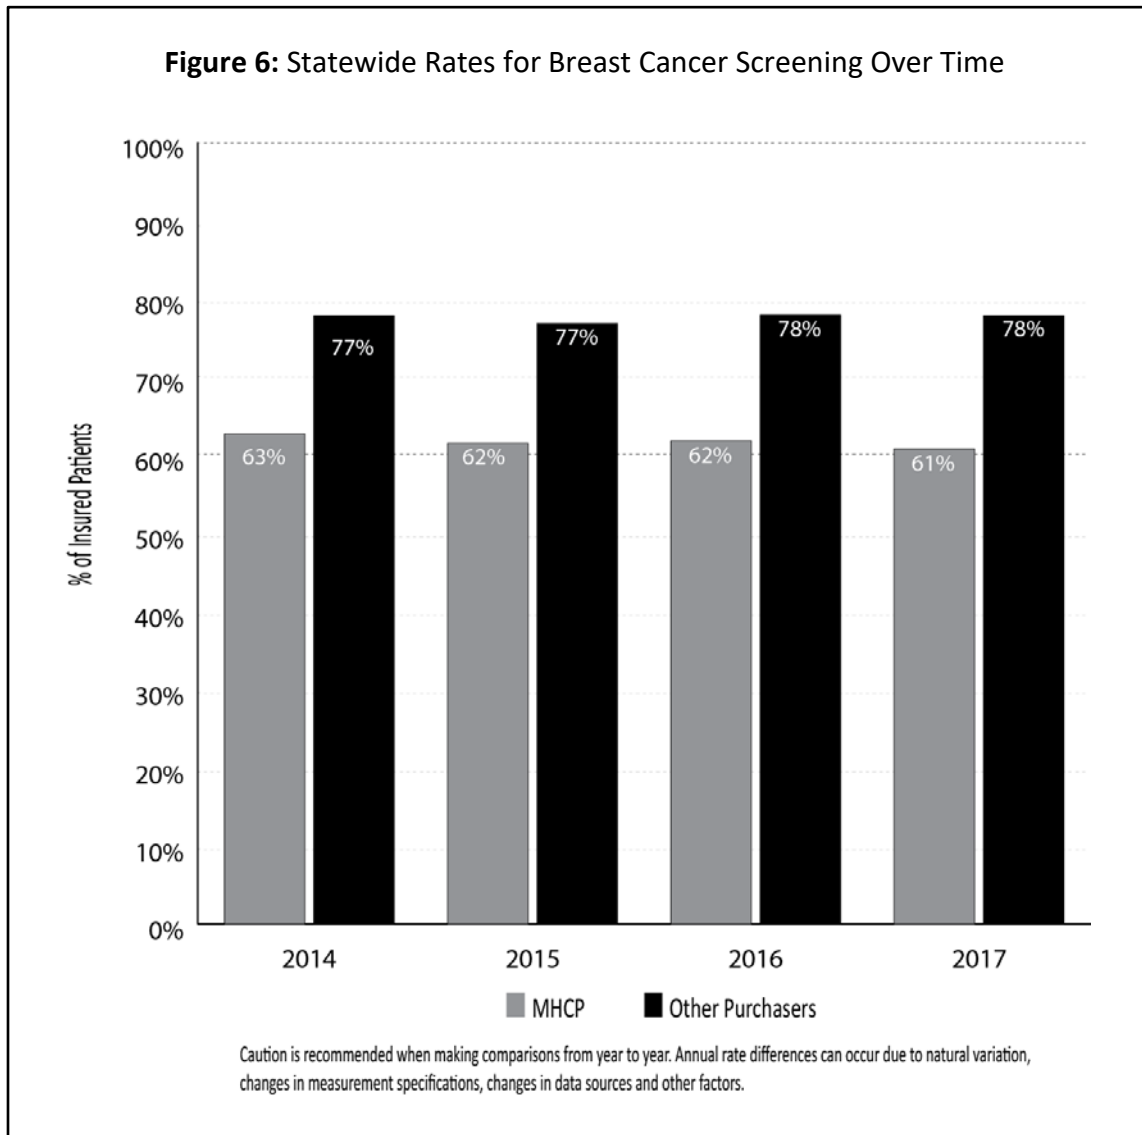

For this measure, MHCP patients had higher rates than patients insured by Other Purchasers. MHCP patients experienced lower rates compared to Other Purchaser patients for this measure from 2006 to 2008. That pattern changed in 2009 and the MHCP rate has remained above the Other Purchaser rate since then. The difference between purchasers has been statistically significant in ten of the twelve years that this measure has been evaluated; only during 2009 and 2010 was the gap not significant.

Breast Cancer Screening

Breast cancer is the second leading cause of cancer death in women, regardless of race or ethnicity. Screening can help improve outcomes and reduce costs. The US Preventive Services Task Force recommends screening for breast cancer in women aged 50 to 74 years.

The Breast Cancer Screening measure evaluates the percentage of women ages 50-74 who received a mammogram during the prior two years. The data for this measure are collected from health plan claims. (See Glossary)

From 2014 to 2017, the percentage of MHCP patients who received a mammogram decreased by almost one percentage point, but this was not statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 6** below for Breast Cancer Screening rates for MHCP and Other Purchasers over time.

MHCP patients continue to have a significantly lower Breast Cancer Screening rate than patients insured by Other Purchasers. This year, the statewide MHCP rate for Breast Cancer Screening was 61 percent and the rate for Other Purchasers was 78 percent. **Table 7** displays statewide rates for each purchaser since measure implementation.

Table 7: Statewide Rates for Breast Cancer Screening

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator	Other Purchaser Rate	Difference (Other-MHCP)
2017	60.8%	60.2% - 61.4%	23,204	77.8%	17.0%**
2016	61.8%	61.2% - 62.4%	24,511	77.9%	16.1%**
2015	61.5%	60.8% - 62.2%	21,143	76.8%	15.3%**
2014	62.7%	61.9% - 63.5%	14,275	77.0%	14.3%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

The difference between purchasers for Breast Cancer Screening widened by almost one percentage point from 2016 to 2017, but this was not statistically significant.

Moderate Decrease in MHCP Rate from 2016 to 2017

Optimal Diabetes Care

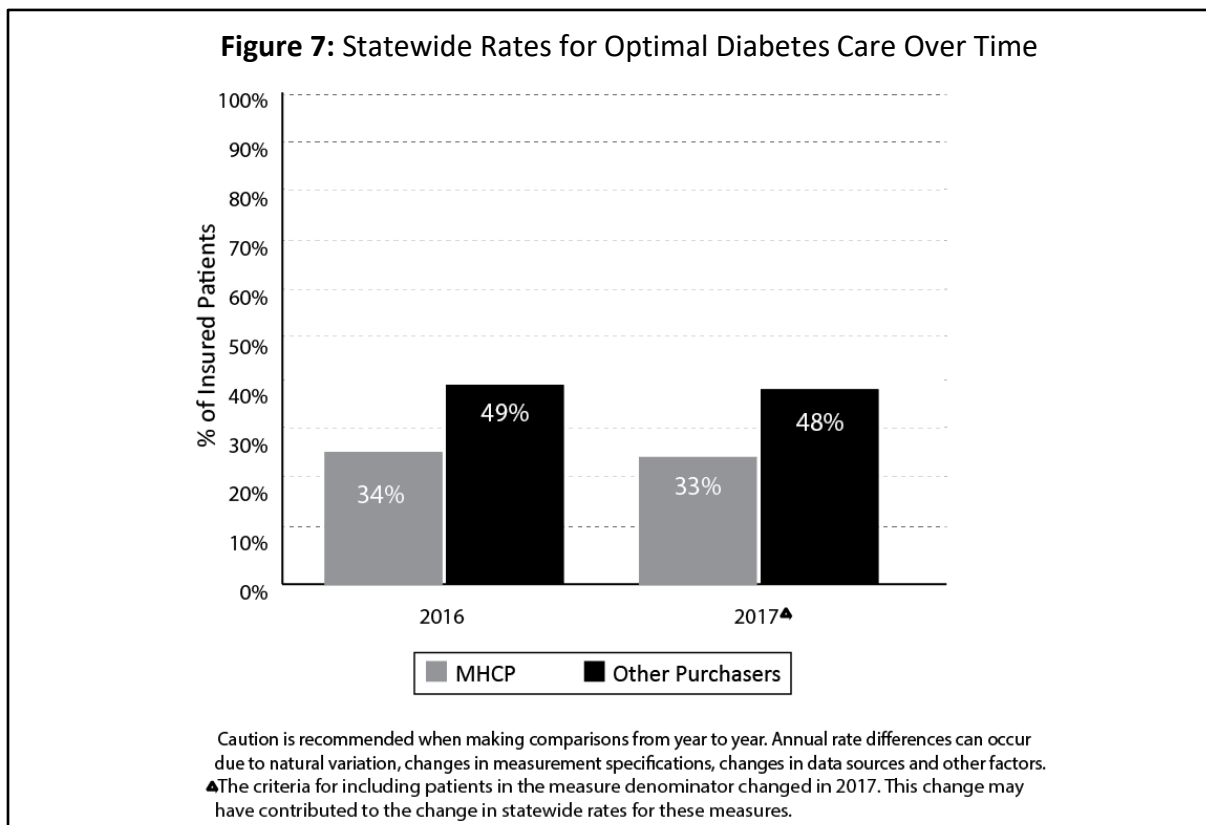

According to the Centers for Disease Control and Prevention (CDC), over 30 million adults aged 18 and older (12.2 percent of all U.S. adults) had diabetes in 2015. The percentage of adults with diabetes increases with age, reaching a high of 25 percent among people over 65 years of age. According to the American Diabetes Association, diabetes care that includes emphasis on blood pressure, lipids, glucose, aspirin use and non-use of tobacco will maximize health outcomes.

The Optimal Diabetes Care measure evaluates the percentage of patients with diabetes (Type I and Type II) ages 18-75 who reached all five of the following treatment goals to reduce cardiovascular risk:

- Blood pressure less than 140/90 mmHg
- Hemoglobin A1c (HBA1c) less than 8
- On a statin medication, unless allowed contraindications or exceptions are present
- Documented tobacco-free status
- Daily aspirin use for patients with a co-morbidity of Ischemic Vascular Disease (unless contraindicated)

Medical groups and clinics submitted data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the percentage of MHCP patients whose diabetes was optimal decreased by one percentage point and this was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 7** below for Optimal Diabetes Care for MHCP and Other Purchasers over time.

For Optimal Diabetes Care in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The statewide rate for Optimal Diabetes Care for MHCP patients was 33 percent; the rate for patients enrolled with Other Purchasers was 48 percent. **Table 8** displays statewide rates for each purchaser since measure implementation.

Table 8: Statewide Rates for Optimal Diabetes Care

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)
2017	32.5%	32.1% - 33.0%	45,023	47.6%	15.1%**
2016	33.6%	33.2% - 34.1%	36,757	48.9%	15.3%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

Optimal Asthma Control – Adults Ages 18-50

According to the CDC, about 25 million American have asthma. This is 7.6 percent of adults and 8.4 percent of children. Asthma has been increasing since the early 1980s in all age, sex and racial groups.

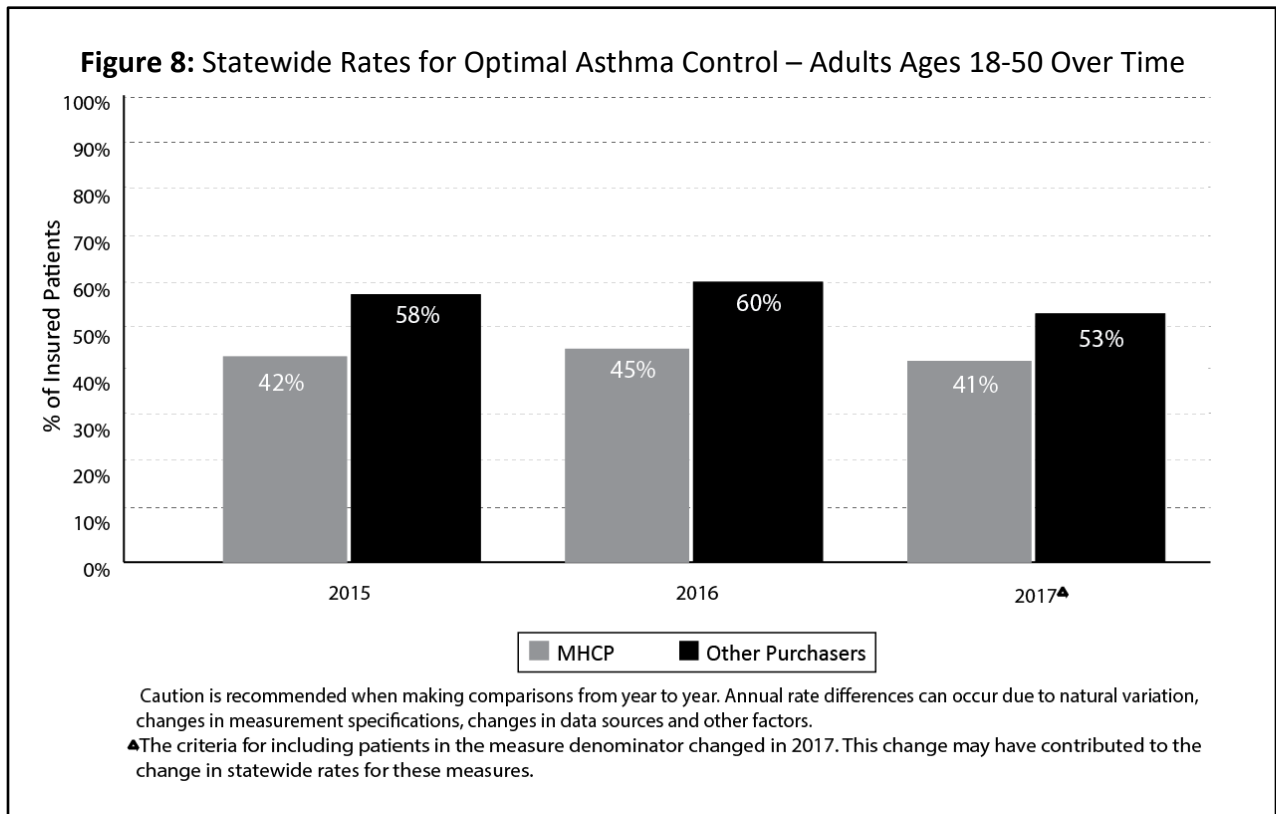

The Optimal Asthma Control measure evaluates the percentage of patients with persistent asthma who attained all of the following targets to control their asthma:

- Evidence of well-controlled asthma using a validated asthma control tool,
- Not at risk for elevated exacerbation as evidenced by no patient-reported emergency department visits and hospitalizations due to asthma,

This measure is segmented into two age categories: children ages 5-17 and adults ages 18-50.

Medical groups and clinics report data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the percentage of MHCP adult patients whose asthma was under control decreased by four percentage points and this was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 8** below for Optimal Asthma Control – Adults Ages 18-50 for MHCP and Other Purchasers over time.

For Optimal Asthma Control – Adults Ages 18-50 in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The statewide rate for Optimal Asthma Control – Adults Ages 18-50 for MHCP patients was 41 percent; the rate for patients enrolled with Other Purchasers was 53 percent. **Table 9** displays statewide rates for each purchaser since measure implementation.

Table 9: Statewide Rates for Optimal Asthma Control – Adults Ages 18-50

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)
2017	40.5%	40.0% - 41.0%	33,142	53.3%	12.8%**
2016	44.6%	43.8% - 45.4%	16,009	60.0%	15.4%**
2015	41.7%	40.9% - 42.5%	14,732	57.8%	16.5%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

Every year has displayed a statistically significant difference between purchasers; however, the gap has narrowed significantly since 2015.

Large Decrease in MHCP Rate from 2016 to 2017

Optimal Vascular Care

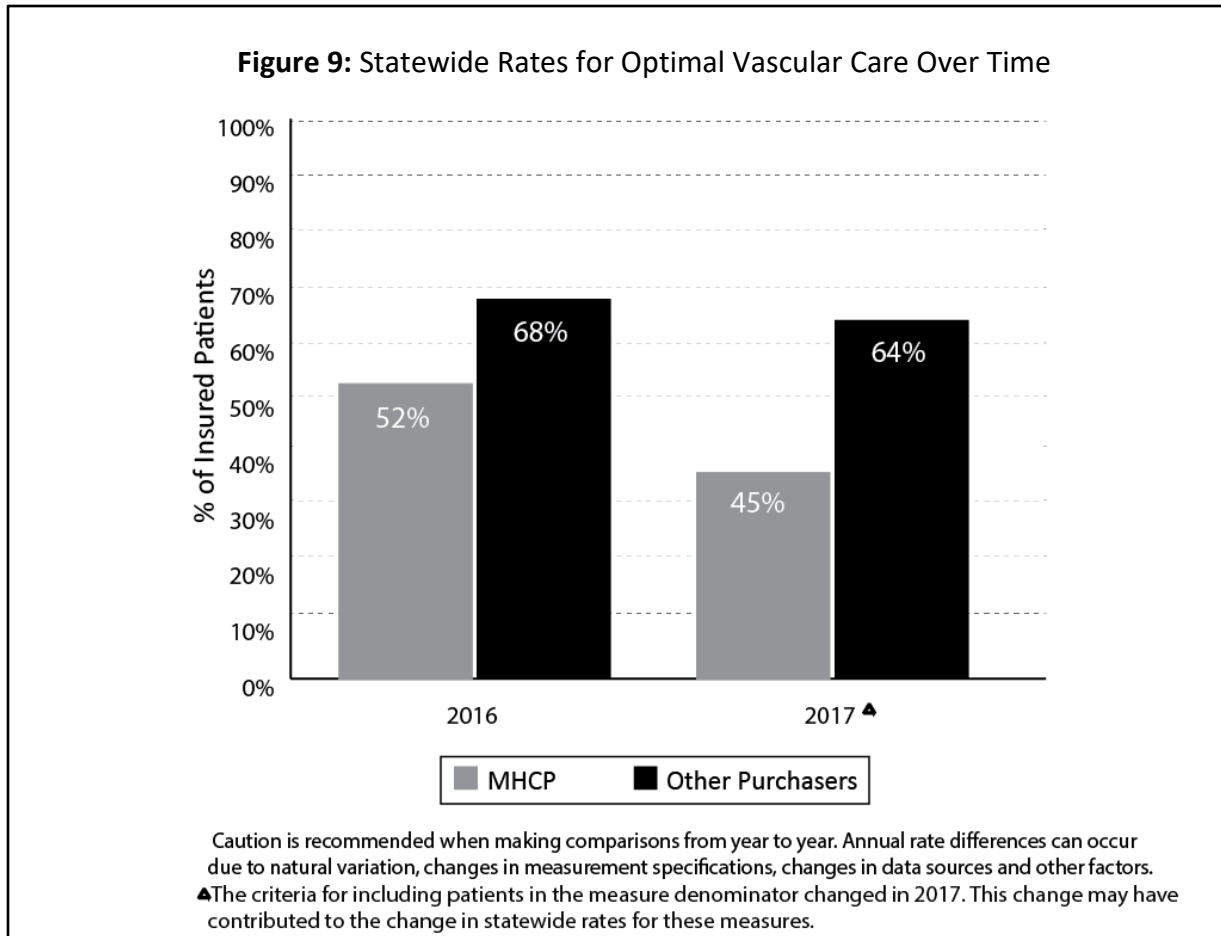

Cardiovascular disease (CVD) is the leading cause of death for men and women in the United States. Considering the overall toll of cardiovascular disease, measures that assess clinical care performance are vital to reducing the negative impacts of CVD.

The Optimal Vascular Care measure evaluates the percentage of patients ages 18-75 with a diagnosis of vascular disease who have reached all four of the following treatment goals to reduce cardiovascular risk:

- Blood pressure less than 140/90 mmHg
- On a statin medication, unless allowed contraindications or exceptions are present
- Documented tobacco-free status
- Daily aspirin use

Medical groups and clinics submitted data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the percentage of MHCP patients whose vascular disease was optimal decreased by seven percentage points and this was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 9** below for Optimal Vascular Care for MHCP and Other Purchasers over time.

For Optimal Vascular Care in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The statewide rate for Optimal Vascular Care for MHCP patients was 45 percent; the rate for patients enrolled with Other Purchasers was 64 percent. **Table 10** displays statewide rates for each purchaser since measure implementation.

Table 10: Statewide Rates for Optimal Vascular Care

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)
2017	45.1%	44.4% - 45.8%	18,307	63.6%	18.5%**
2016	52.3%	51.4% - 53.2%	11,374	68.2%	15.9%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

Optimal Asthma Control – Children Ages 5-17

According to the CDC, about 25 million American have asthma. This is 7.6 percent of adults and 8.4 percent of children. Asthma has been increasing since the early 1980s in all age, sex, and racial groups.

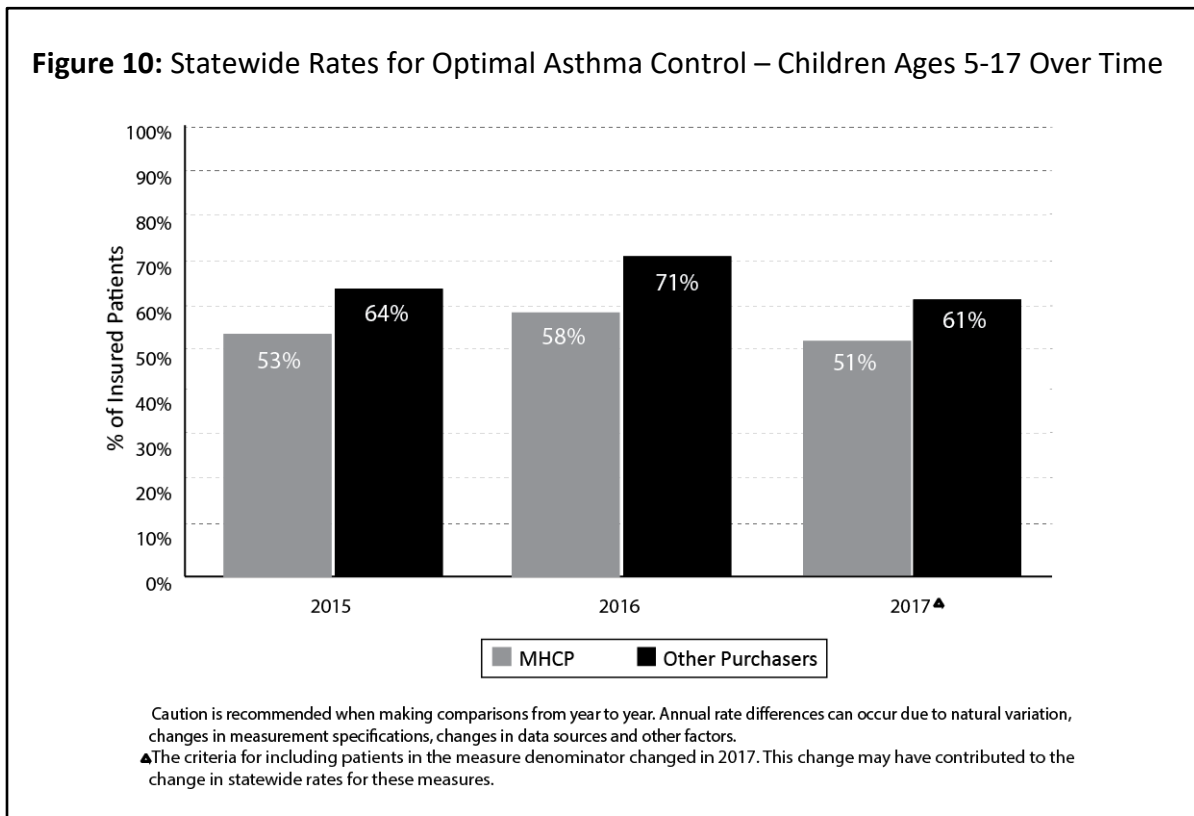

The Optimal Asthma Control measure evaluates the percentage of patients with persistent asthma who attained all of the following targets to control their asthma:

- Evidence of well-controlled asthma using a validated asthma control tool,
- Not at risk for elevated exacerbation as evidenced by no patient-reported emergency department visits and hospitalizations due to asthma

This measure is segmented into two age categories: children ages 5-17 and adults ages 18-50.

Medical groups and clinics report data directly to MNMCM for this measure based on electronic health records or paper-based medical charts. (See Glossary)

From 2016 to 2017, the percentage of MHCP patients whose asthma was under control decreased by seven percentage points and this was statistically significant. In 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. See **Figure 10** below for Optimal Asthma Control – Children Ages 5-17 for MHCP and Other Purchasers over time.

For Optimal Asthma Control – Children Ages 5-17 in 2017, MHCP patients had a significantly lower rate than Other Purchaser patients. The statewide rate for Optimal Asthma Control – Children Ages 5-17 for MHCP patients was 51 percent; the rate for patients enrolled with Other Purchasers was 61 percent. **Table 11** displays statewide rates for each purchaser since measure implementation

Table 11: Statewide Rates for Optimal Asthma Control – Children Ages 5-17

Year	MHCP Rate	MHCP CI (U/L)	MHCP Denominator (Patients Sampled)	Other Purchaser Rate	Difference (Other-MHCP)
2017	51.0%	50.4% - 51.6%	25,272	61.1%	10.1%**
2016	58.3%	57.5% - 59.0%	15,438	70.5%	12.3%**
2015	53.0%	52.1% - 53.8%	13,689	63.8%	10.8%**

* A confidence interval gives an estimated range of values calculated from a given sample of data. A 95 percent confidence interval implies a 95 percent level of confidence that the interval includes the true mean or parameter.

** Denotes a statistically significant difference.

The difference between purchasers for Optimal Asthma Control – Children Ages 5-17 narrowed by over two percentage points from 2016 to 2017, which is statistically significant. However, this difference did not change significantly from 2015 to 2017.

Medical Group/Clinic Level Performance Results

Childhood Immunization Status (Combo 10) by Medical Group

For the 2017 report year, 22 medical groups were reportable for the Childhood Immunization Status (Combo 10) measure because they had at least 60 patients in their sample – a large enough sample to ensure a reasonable level of confidence in the reported rate. These 22 medical groups accounted for 2,176 of the 3,163 MHCP patients (69 percent) who were eligible for this measure statewide, and the 22 reportable medical groups accounted for 22 percent of medical groups providing care to MHCP patients in Minnesota identified through health plan claims data for this measure.

The most successful medical group for this measure, **HealthEast Clinics**, achieved best practice with 59 percent of their MHCP patients; while the least successful, **St. Luke's Clinics** had no patients who achieved best practice. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Eight medical groups had rates and confidence intervals greater than the statewide medical group average (39 percent) for MHCP patients. These medical groups are listed below in order of highest to lowest performance.

- HealthEast Clinics
- Mankato Clinic, Ltd.
- Mayo Clinic Health System-Owatonna
- Mayo Clinic
- HealthPartners Clinics
- Sanford Health - Sioux Falls Region
- CentraCare Health
- Allina Health

Largest Improvement from 2016 to 2017

The measure specification was revised this year to Combo 10, which includes three additional vaccines: pneumococcal conjugate (PCV), rotavirus, and influenza. Due to this change, no trend data is available for this measure this year.

Medical Group Performance over Time (2015 to 2017)

The measure specification was revised this year to Combo 10, which includes three additional vaccines: pneumococcal conjugate (PCV), rotavirus, and influenza. Due to this change, no trend data is available for this measure this year.

Controlling High Blood Pressure by Medical Group

For the 2017 report year, 58 medical groups were reportable for the Controlling High Blood Pressure measure because they had at least 60 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 58 medical groups accounted for 8,374 of the 9,871 MHCP patients (85 percent) who were eligible for this measure statewide, and the 58 reportable medical groups accounted for 41 percent of medical groups providing care to MHCP patients in Minnesota who have been identified through health plan claims data for this measure.

The most successful medical group for this measure, **Entira Family Clinics**, achieved best practice with 89 percent of their MHCP patients; while the least successful, **Advanced Medical Clinic**, achieved it with 28 percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Fourteen medical groups had rates and confidence intervals greater than the statewide medical group average (72 percent) for MHCP patients. These medical groups are listed below in order from highest to lowest performance.

- Entira Family Clinics
- Mayo Clinic Health System - Mankato
- CentraCare Health
- Sanford Health - Fargo Region
- HealthPartners Clinics
- Allina Health

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Controlling High Blood Pressure was made by **University of Minnesota Physicians**, which achieved a 26 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Colorectal Cancer Screening by Clinic

For the 2017 report year, 531 clinics were reportable for the Colorectal Cancer Screening measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 531 clinics accounted for 114,324 of the 118,418 MHCP patients (97 percent) who were eligible for this measure statewide, and the 531 reportable clinics accounted for 75 percent of clinics providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful clinic for this measure, **Obstetrics, Gynecology and Infertility - Edina**, achieved best practices with 92 percent of their MHCP patients; while the least successful, **AXIS Medical Center**, achieved it with only one percent of their MHCP patients. A detailed table of clinic level performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

One hundred forty-three clinics had rates and confidence intervals greater than the statewide average (56 percent) for MHCP patients. These clinics are listed below in order from high to low performance for each column, and from highest in the left column to lowest in the right column.

- Obstetrics, Gynecology and Infertility - Edina
- Obstetrics, Gynecology and Infertility - Maple Grove
- CentraCare Health Plaza- Internal Medicine
- CentraCare Health- Long Prairie
- Hennepin County Medical Center (HCMC) Clinics - Golden Valley Clinic
- CentraCare Health Plaza- Obstetrics and Women's Clinic
- Allina Health Specialties - Abbott Northwestern General Medicine Associates - Edina
- Allina Health - Chanhassen
- Sanford Bemidji Main Clinic - Internal Medicine
- HealthPartners - Ctr for Internatl Hlth
- Mayo Clinic Health System Faribault Campus Location

Largest Improvement from 2016 to 2017

The largest clinic level improvement since report year 2016 in Colorectal Cancer Screening was made by **Hennepin County Medical Center (HCMC) Clinics - Golden Valley Clinic**, which achieved a 33 percentage point increase for their MHCP patients.

Colorectal Cancer Screening by Medical Group

For the 2017 report year, 100 medical groups were reportable for the Colorectal Cancer Screening measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 101 medical groups accounted for 116,135 of the 118,418 MHCP patients (98 percent) who are eligible for this measure statewide, and the 100 reportable medical groups accounted for 81 percent of medical groups providing care to MHCP patients in Minnesota who submitted data to MNMCM for this measure.

The most successful medical group for this measure, **Obstetrics and Gynecology Associates**, achieved best practice with 85 percent of their MHCP patients; while the least successful medical group, **Axis Medical Center**, achieved best practice with only one percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Eighteen medical groups had rates and confidence intervals greater than the statewide average (56 percent) for MHCP patients. These medical groups are listed below in order from high to low performance for each column.

- Obstetrics and Gynecology Associates
- Southdale Ob/Gyn Consultants
- Ortonville Area Health Services-Northside Medical Clinic
- Oakdale Ob/Gyn
- Fairview Health Services
- Mayo Clinic
- Alexandria Clinic
- Allina Health Clinics
- Lakewood Health System
- Sanford Health - Fargo Region
- HealthPartners Clinics
- Allina Health Specialties
- Mankato Clinic, Ltd.
- Mayo Clinic Health System
- CentraCare Health
- Essentia Health
- Sanford Health - Sioux Falls Region
- Park Nicollet Health Services

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Colorectal Cancer Screening was made by **Open Door Health Center**, which achieved a 17 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015-2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Chlamydia Screening in Women by Medical Group

For the 2017 report year, 72 medical groups were reportable for the Chlamydia Screening in Women measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 72 medical groups accounted for 16,654 of the 19,461 MHCP patients (86 percent) who were eligible for this measure statewide, and the 72 reportable medical groups accounted for 47 percent of medical groups providing care to MHCP patients in Minnesota who have been identified through health plan claims data for this measure.

The most successful medical group in this measure, **Face to Face Health & Counseling Service, Inc.**, achieved best practice with 85 percent of their MHCP patients; while the least successful, **Glencoe Regional Health Services**, achieved it with only nine percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Eleven medical groups had rates and confidence intervals greater than the statewide medical group average (57 percent) for MHCP patients. These medical groups are listed in order of highest to lowest performance.

- Face to Face Health & Counseling Service, Inc.
- Planned Parenthood Minnesota, North Dakota, South Dakota
- HealthPartners Clinics
- NorthPoint Health & Wellness Center
- Obstetrics and Gynecology Associates
- Allina Health
- Park Nicollet Health Services
- Hennepin County Medical Center (HCMC) Clinics
- Entira Family Clinics
- Fairview Medical Group
- CentraCare Health

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Chlamydia Screening in Women was made by **Alexandria Clinic**, which achieved a 24 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Depression Remission at Six Months by Clinic

For the 2017 report year, 277 clinics were reportable for the Depression Remission at Six Months measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 277 clinics accounted for 21,691 of the 25,551 MHCP patients (85 percent) who were eligible for this measure statewide, and the 277 reportable clinics accounted for 45 percent of clinics providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful clinic for this measure, **Entira Family Clinics - West St. Paul**, achieved remission at six months with 32 percent of their MHCP patients. Fifty-five clinics tied for having no MHCP patients who achieved depression remission at six months. A detailed table of clinic performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

Thirty-one clinics had rates and confidence intervals greater than the statewide average (five percent) for MHCP patients. These clinics are listed below in order from high to low performance for each column, and from highest in the left column to lowest in the right column.

- Entira Family Clinics - West St. Paul
- Park Nicollet Clinic - Plymouth
- Park Nicollet Clinic - Bloomington
- CentraCare Health- Sauk Centre
- Mayo Clinic - Northwest
- Park Nicollet Clinic - Shakopee
- Allina Health - Farmington

- Allina Health - Northfield
- Olmsted Medical Center - Rochester Southeast - Psychiatry
- Allina Health - West St. Paul
- Allina Health - Cambridge
- Park Nicollet Clinic - Psychiatry

Largest Improvement from 2016 to 2017

The largest clinic improvement since report year 2016 in Depression Remission at Six Months was made by **Park Nicollet Clinic - St. Louis Park Internal Medicine**, achieving a 13 percentage point increase for their MHCP patients.

Appropriate Treatment for Children with URI by Medical Group

For the 2017 report year, 84 medical groups were reportable for the Appropriate Treatment for Children with URI measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 84 medical groups accounted for 16,117 of the 18,978 MHCP patients (85 percent) who are eligible for this measure statewide, and the 84 reportable medical groups accounted for 54 percent of medical groups providing care to MHCP patients in Minnesota who have been identified through health plan claims data for this measure.

Eight medical groups achieved optimal care with 100 percent of their MHCP patients: **North Clinic, United Family Medicine, Cedar Riverside People’s Center, South Lake Pediatrics, West Side Community Health Services, MinuteClinic, FirstLight Health System, and Mayo Clinic Health System – St. James**. The least successful medical group, **RiverView Health**, achieved best practice with 55 percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Fifteen medical groups had rates and confidence intervals greater than the statewide medical group average (93 percent) for MHCP patients. These medical groups are listed below in order from high to low performance for each column.

- United Family Medicine
- South Lake Pediatrics
- West Side Community Health Services
- MinuteClinic
- FirstLight Health System
- Stellis Health, PA
- University of Minnesota Physicians
- HealthEast Clinics
- Hennepin County Medical Center (HCMC) Clinics
- HealthPartners Clinics
- Park Nicollet Health Services
- Children's Clinic Network
- Emergency Physicians, P.A.
- Allina Health
- Fairview Medical Group

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Appropriate Treatment for Children with URI was made by **Tri-County Health Care**, which achieved an 11 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015-2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Breast Cancer Screening by Medical Group

For the 2017 report year, 64 medical groups were reportable for the Breast Cancer Screening measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 64 medical groups accounted for 15,602 of the 21,412 MHCP patients (73 percent) who were eligible for this measure statewide, and the 64 reportable medical groups accounted for 47 percent of the medical groups providing care to MHCP patients in Minnesota who have been identified through health plan claims data for this measure.

The most successful medical group for this measure, **Alexandria Clinic**, achieved best practice with 85 percent of their MHCP patients; while the least successful, **Advanced Medical Clinic**, achieved it with 15 percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Twenty-one medical groups had rates and confidence intervals greater than the statewide medical group average (63 percent) for MHCP patients. These medical groups are listed below in order from highest to lowest.

- Alexandria Clinic
- Mayo Clinic Health System - Waseca
- Mayo Clinic Health System - Lake City
- Multicare Associates
- Tri-County Health Care
- Stellis Health, PA
- HealthPartners Clinics
- Mayo Clinic Health System-Owatonna
- NorthPoint Health & Wellness Center
- Mayo Clinic Health System - Mankato
- Mayo Clinic
- Allina Health
- Mayo Clinic Health System - Red Wing
- Affiliated Community Medical Centers
- Fairview Medical Group
- Mankato Clinic, Ltd.
- Sanford Health - Fargo Region
- HealthEast Clinics
- Essentia Health
- CentraCare Health
- Park Nicollet Health Services

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Breast Cancer Screening was made by **Lake Region Healthcare**, which achieved a 16 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Optimal Diabetes Care by Clinic

For the 2017 report year, 369 clinics were reportable for the Optimal Diabetes Care measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 369 clinics accounted for 41,546 of the 45,130 MHCP patients (92 percent) who were eligible for this measure statewide, and the 369 reportable clinics accounted for 58 percent of clinics providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful clinic in this measure, **Fairview Bloomington Lake Xerxes** achieved optimal care with 63 percent of their MHCP patients; while the least successful, **Prairie Ridge Hospital & Health Services - Elbow Lake**, achieved it with three percent of their MHCP patients. A detailed table of clinic performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

Fifty-five clinics had rates and confidence intervals that were greater than the statewide average (33 percent) for MHCP patients. These clinics are listed below in order from high to low performance for each column, and from highest in the left column to lowest in the right column.

- Fairview Bloomington Lake Xerxes

Largest Improvement from 2016 to 2017

The largest clinic level improvement since report year 2016 in Optimal Diabetes Care was made by **Fairview Bloomington Lake Xerxes**, which achieved a 27 percentage point increase for their MHCP patients.

Optimal Diabetes Care by Medical Group

For the 2017 report year, 74 medical groups were reportable for the Optimal Diabetes Care measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 74 medical groups accounted for 44,759 of the 45,130 MHCP patients (99 percent) who were eligible for this measure statewide, and the 74 reportable medical groups accounted for 76 percent of medical groups providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful medical group in this measure, **Fairview Health Services**, achieved optimal care with 45 percent of their MHCP patients, while the least successful, **Lakewood Health Center Clinic**, achieved it with less than seven percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Eight medical groups had rates and confidence intervals greater than the statewide average (33 percent) for MHCP patients. These medical groups are listed below in order of highest to lowest performance.

- Fairview Health Services
- Apple Valley Medical Clinic
- Entira Family Clinics
- Sanford Health - Sioux Falls Region
- Park Nicollet Health Services
- Allina Health Clinics
- HealthPartners Clinics
- Mayo Clinic Health System

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Optimal Diabetes Care was made by **Southside Community Health Services**, which achieved a 14 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

The measure specification was revised in 2016 to include the statin use component in the measure calculation. Due to this change, no trend data is available for this measure this year.

Optimal Asthma Control – Adults Ages 18-50 by Clinic

For the 2017 report year, 323 clinics were reportable for the Optimal Asthma Control – Adults Ages 18-50 measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 323 clinics accounted for 29,102 of the 33,142 MHCP patients (88 percent) who were eligible for this measure statewide, and the 323 reportable clinics accounted for 48 percent of clinics providing care to MHCP patients ages 18-50 in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

There was wide variation in the success of clinics to achieve optimal asthma care with their MHCP patients ages 18-50. The variation could be due to a number of factors, some of which can be influenced by a clinic. The most successful clinic for this measure, **Park Nicollet Clinic - Golden Valley**, achieved optimal care with 79 percent of their MHCP patients ages 18-50. There were fourteen clinics that tied for having no MHCP patients age 18-50 achieved optimal asthma control. A detailed table of clinic level performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

One hundred and twelve clinics had rates and confidence intervals that were greater than the statewide average (40 percent) for MHCP patients aged 18-50. These clinics are listed below in order from high to low performance for each column, and from highest in the left column to lowest in the right column.

- Park Nicollet Clinic - Golden Valley

Largest Improvement from 2016 to 2017

The largest clinic level improvement since report year 2016 in Optimal Asthma Control - Adults was made by **Park Nicollet Clinic - Prior Lake**, which achieved a 29 percentage point increase for their MHCP patients.

Optimal Asthma Control – Adults Ages 18-50 by Medical Group

For the 2017 report year, 71 medical groups were reportable for the Optimal Asthma Control – Adults Ages 18-50 measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 71 medical groups accounted for 32,621 of the 33,142 MHCP patients (98 percent) who were eligible for this measure statewide, and the 71 reportable medical groups accounted for 62 percent of medical groups providing care to MHCP patients ages 18-50 in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

There was wide variation in the success of medical groups to achieve optimal asthma care with their MHCP patients ages 18-50. The variation could be due to a number of factors, some of which can be influenced by a medical group. The most successful medical group for this measure, **South Lake Pediatrics**, achieved optimal asthma control with 81 percent of their MHCP patients ages 18-50. There were six medical groups that tied for having no MHCP patients ages 18-50 who achieved optimal asthma care. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Fifteen medical groups had rates and confidence intervals greater than the statewide average (40 percent) for MHCP patients ages 18-50. These medical groups are listed below in order of highest to lowest performance.

- South Lake Pediatrics
- HealthPartners Central Minnesota Clinics
- Fairview Health Services
- Children's Respiratory & Critical Care Specialists
- Mankato Clinic, Ltd.
- Allina Health Clinics
- Park Nicollet Health Services
- Sanford Health - Sioux Falls Region
- FirstLight Health System
- HealthPartners Clinics
- Affiliated Community Medical Centers
- Entira Family Clinics
- CentraCare Health
- Mayo Clinic Health System
- Essentia Health

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Optimal Asthma Control - Adults was made by **Riverwood Healthcare Center**, which achieved a 34 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Optimal Vascular Care by Clinic

For the 2017 report year, 180 clinics were reportable for the Optimal Vascular Care measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 107 clinics accounted for 13,521 of the 18,307 MHCP patients (74 percent) who were eligible for this measure statewide, and the 107 reportable clinics accounted for 17 percent of clinics providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful clinic for this measure, **Fairview Crosstown Clinic**, achieved optimal care with 77 percent of their MHCP patients; while the least successful, **Community-University Health Care Center**, achieved it with 21 percent of their MHCP patients. A detailed table of clinic performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

Twenty clinics had rates and confidence intervals greater than the statewide clinic average (45 percent) for MHCP patients. These clinics are listed below in order from highest to lowest performance.

- Fairview Crosstown Clinic
- Entira Family Clinics - East Side
- Sanford Health Vermillion Clinic
- Fairview Eagan Clinic
- Fairview Oxboro Clinic
- HealthPartners - Ctr for Internatl Hlth
- University of Minnesota Heart Care at Fairview Ridges Specialty Care Center
- CentraCare Health Plaza-Family Medicine
- Fairview Fridley Clinic
- HealthPartners - Como
- Fairview Brooklyn Park Clinic
- University of Minnesota Heart Care at Fairview Southdale Hospital
- Fairview Burnsville Clinic
- HealthEast Rice Street Clinic
- University of Minnesota Health Heart Care at University of Minnesota Medical Center
- Sanford Sioux Falls Cardiovascular Institute
- Allina Health Specialties - United Heart and Vascular Clinic
- Allina Health Specialties - Metropolitan Heart & Vascular Inst. - Coon Rapids
- Allina Health - Coon Rapids
- Allina Health Specialties - Minneapolis Heart Institute - ANW

Largest Improvement from 2016 to 2017

The largest clinic level improvement since report year 2016 in Optimal Vascular Care was made by **Fairview Eagan Clinic**, which achieved a 23 percentage point increase for their MHCP patients.

Optimal Vascular Care by Medical Group

For the 2017 report year, 54 medical groups were reportable for the Optimal Vascular Care measure because they had at least 30 patients that met measure specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 42 medical groups accounted for 17,965 of the 19,307 MHCP patients (93 percent) who were eligible for this measure statewide, and the 54 reportable medical groups accounted for 58 percent of medical groups providing care to MHCP patients in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

There was wide variation in the success of medical groups to achieve optimal vascular care with their MHCP patients. The most successful medical group for this measure, **Fairview Health Services**, achieved optimal care with 59 percent of their MHCP patients; while, the least successful, **Open Cities Health Center**, achieved it with only twenty percent of their MHCP patients. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Five medical groups had rates and confidence intervals greater than the statewide medical group average (45 percent) for MHCP patients. These medical groups are listed below in order from highest to lowest performance.

- Fairview Health Services
- Allina Health Specialties
- Mayo Clinic
- University of Minnesota Physicians
- Allina Health Clinics

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Optimal Vascular Care was made by **Avera Medical Group**, which achieved a 17 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015 to 2017)

The measure specification was revised in 2016 to include the statin use component in the measure calculation. Due to this change, no trend data is available for this measure this year.

Optimal Asthma Control – Children Ages 5-17 by Clinic

For the 2017 report year, 207 clinics were reportable for the Optimal Asthma Control – Children Ages 5-17 measure because they had at least 30 patients that met the measurement specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 207 clinics accounted for 20,597 of the 25,272 MHCP patients (82 percent) who were eligible for this measure statewide, and the 207 reportable clinics accounted for 33 percent of clinics providing care to MHCP patients ages 5-17 in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful clinic, **Advancements in Allergy and Asthma Care, Ltd.**, achieved optimal care with 92 percent of their MHCP patients ages 5-17. Four clinics tied for having no MHCP patients who achieved optimal asthma control. A detailed table of clinic performance rates can be found in Appendix 3.

Clinics with Above Average MHCP Rates in Report Year 2017

Sixty-eight clinics had rates and confidence intervals that were greater than the statewide clinic average (51 percent) for MHCP patients ages 5-17. These clinics are listed below in order from high to low performance for each column, and from highest in the left column to lowest in the right column.

Largest Improvement from 2016 to 2017

The largest clinic level improvement since report year 2016 in Optimal Asthma Control – Children was made by **HealthPartners - Apple Valley**, which achieved an 18 percentage point increase for their MHCP patients.

Optimal Asthma Control – Children Ages 5-17 by Medical Group

For the 2017 report year, 67 medical groups were reportable for the Optimal Asthma Control – Children Ages 5-17 measure because they had at least 30 patients that met measure specifications – enough patients to ensure a reasonable level of confidence in the reported rate. These 67 medical groups accounted for 24,818 of the 25,272 MHCP patients (98 percent) who were eligible for this measure statewide, and the 67 reportable medical groups accounted for 61 percent of medical groups providing care to MHCP patients ages 5-17 in Minnesota and surrounding areas who submitted data to MNMCM for this measure.

The most successful medical group for this measure, **Advancements in Allergy and Asthma Care**, achieved optimal care with 92 percent of their MHCP patients ages 5-17. There were two medical groups (**North Clinic** and **Raiter Clinic, LTD - IHN**) that tied for having no MHCP patients ages 5-17 who achieved optimal asthma control. A detailed table of medical group performance rates can be found in Appendix 3.

Medical Groups with Above Average MHCP Rates in Report Year 2017

Twenty medical groups had rates and confidence intervals greater than the statewide medical group average (51 percent) for MHCP patients ages 5-17. These medical groups are listed below in order of highest to lowest performance.

- Advancements in Allergy and Asthma Care
- Wayzata Children's Clinic
- South Lake Pediatrics
- HealthPartners Central Minnesota Clinics
- Allergy, Asthma & Immunology Clinic
- CentraCare Health
- Central Pediatrics
- Lakewood Health System
- Fairview Health Services
- Affiliated Community Medical Centers
- Sanford Health - Sioux Falls Region
- Mayo Clinic
- Children's Respiratory & Critical Care Specialists
- Mankato Clinic, Ltd.
- Hennepin County Medical Center (HCMC) Clinics
- Park Nicollet Health Services
- Allina Health Clinics
- Mayo Clinic Health System
- HealthPartners Clinics
- Essentia Health

Largest Improvement from 2016 to 2017

The largest medical group improvement since report year 2016 in Optimal Asthma Control - Children was made by **Lakewood Health System**, which achieved a 36 percentage point increase for their MHCP patients.

Medical Group Performance over Time (2015-2017)

A detailed table of medical group performance over time can be found in Appendix 4.

Please see next page.

An Examination of Statewide MHCP Performance Rates by Race and Hispanic Ethnicity

Health care disparities are well-documented and persistent in the United States. These disparities are often based on socioeconomic status, race and ethnicity. Increased reporting of health outcomes by socioeconomic status, race and ethnicity is needed to promote equity of care and evaluate where the gaps remain.⁵

In Minnesota, results from our *Health Care Disparities Reports* have shown patients of lower socioeconomic status have different rates of care even when health care coverage is available, as is the case for patients enrolled in MHCP. These disparities result from multiple factors, one of which may be that a higher proportion of MHCP patients are members of underserved races and ethnicities. Researchers agree that collecting and using data on the races and ethnicities of certain patient populations may build a foundation for understanding and reducing disparities.^{1,4} For some measures, available data allows us to examine performance rate differences by race and Hispanic ethnicity at a statewide level within the MHCP patient population.

Methods

Statewide comparisons by race and Hispanic ethnicity were conducted on the MHCP patient population using enrollment data supplied by the Minnesota Department of Human Services (DHS). DHS sends monthly enrollment data to health plans that contract with the Department to provide health care services to MHCP recipients. This enrollment data includes race and Hispanic ethnicity information for these patients. Race and ethnicity is self-reported by recipients at the time they enroll in MHCP. Recipients are able to declare more than one race on their enrollment form.

Each patient was placed in one of the following race categories:

- American Indian or Alaska Native
- Asian or Pacific Islander or Native Hawaiian
- Black or African American
- Multi-Racial
- Unknown
- White

Each patient was also placed in the one of the following Hispanic ethnicity categories:

- Hispanic
- Non-Hispanic
- Unknown

These categories generally comply with the Office of Management and Budget directive to provide an accurate basis for comparison purposes. However, Pacific Islander or Native Hawaiian is combined with Asian in this report because of the small number of patients who identified themselves as Pacific Islander or Native Hawaiian. Patients are able to declare more than one race when they enroll in MHCP, allowing MNMCM to calculate rates for a Multi-Racial category. For the analyses within this report, race and Hispanic ethnicity are reported separately. Results are presented for race and Hispanic ethnicity only if there are at least 30 patients in the category.

The following measures are not reported by race and Hispanic ethnicity in this report: Optimal Diabetes Care, Optimal Vascular Care, Depression Remission at Six Months, Optimal Asthma Control - Children Ages 5-17, Optimal Asthma Control - Adults Ages 18-50 and Colorectal Cancer Screening. As more clinics submit these data elements and as the data are validated for best practice, MNMCM will be able to report a statewide MHCP rate for these measures by race and Hispanic ethnicity.

⁵ Institute of Medicine (1999). *Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care*.

Race Descriptions[†]

- American Indian or Alaskan Native: A person having origins in any of the original peoples of North and South America (including Central America), and who maintains tribal affiliation or community attachment.
- Asian or Pacific Islander or Native Hawaiian: A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent, or a person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands.
- Black or African American: A person having origins in any of the black racial groups of Africa. Terms such as “Haitian” or “Negro” can be used in addition to “Black or African American.”
- Multi-Racial: A person self-identifying with more than one of the following races: American Indian or Alaskan Native; Asian or Pacific Islander or Native Hawaiian; Black or African American; and White. People in this category did not select a catch-all “multi-racial” or “more than one race” category; instead, it was created for reporting purposes.
- Unknown: A person who has not self-reported his or her race during enrollment in MHCP.
- White: A person having origins in any of the original peoples of Europe, the Middle East or North Africa.

Hispanic Ethnicity Descriptions

- Hispanic or Latino: A person of Cuban, Mexican, Puerto Rican, South or Central American or other Spanish culture or origin. The term “Spanish origin” can be used in addition to “Hispanic or Latino.”
- Non-Hispanic: A person who is not of Cuban, Mexican, Puerto Rican, South or Central American or other Spanish culture or origin.
- Unknown: A person who has not self-reported his or her ethnicity during enrollment in MHCP.

[†] Race and Hispanic Ethnicity definitions are from the Office of Management and Budget.

Childhood Immunization Status (Combo 10)

Figure 11.1 shows Childhood Immunization Status (Combo 10) by race. The Asian or Pacific Islander or Native Hawaiian group had the highest rate of childhood immunizations (47 percent), and this rate was significantly above the MHCP statewide rate (38 percent). The only other racial group that had a rate significantly above the MHCP statewide rate was the Unknown racial group at 41 percent. The Black or African American and American Indian or Alaskan Native racial groups had rates significantly below the statewide MHCP rate, with the American Indian or Alaskan Native racial group having the lowest rate.

Figure 11.1: Childhood Immunization Status (Combo 10) Statewide Rates by Race

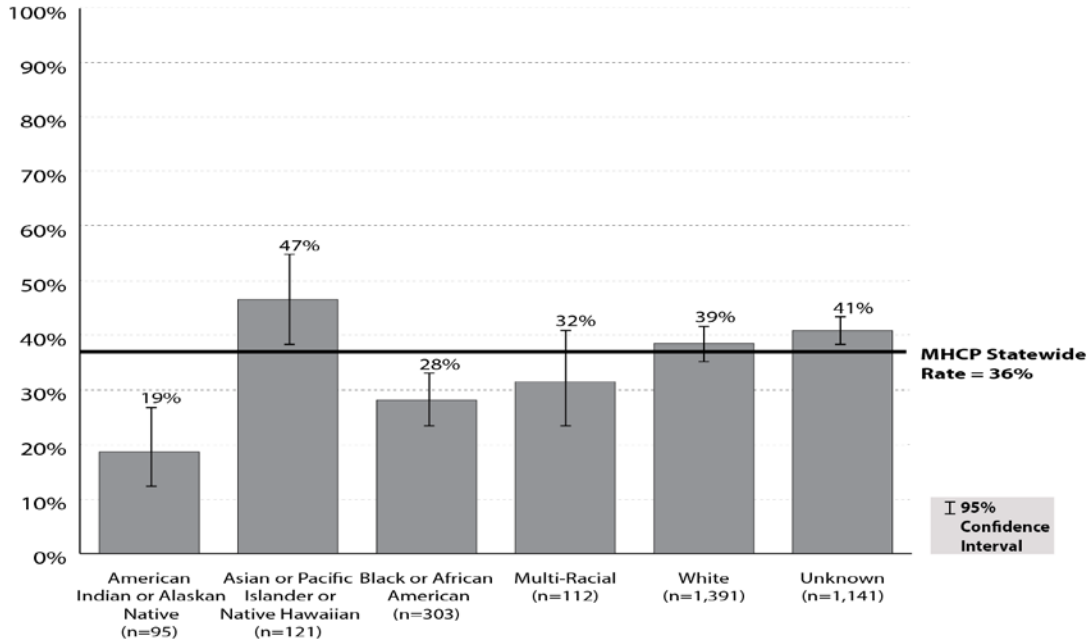

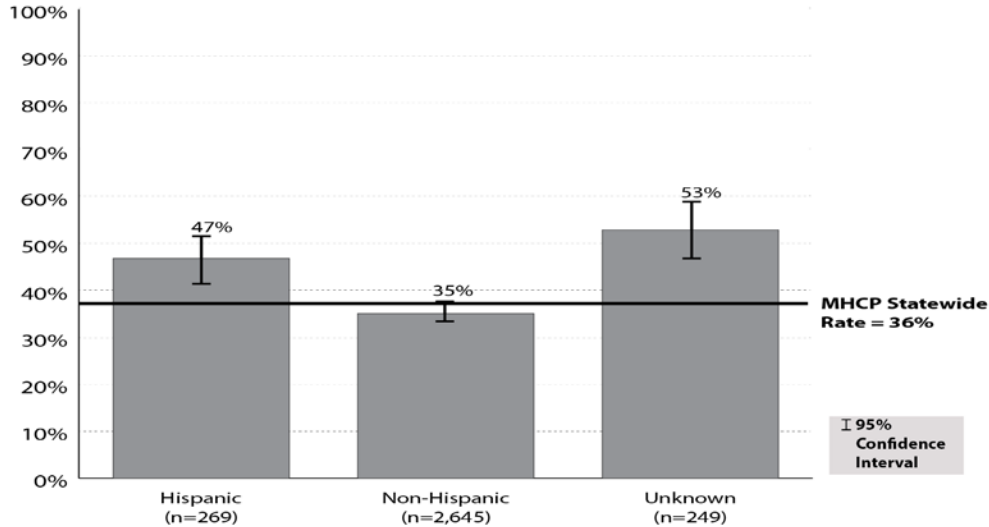

Figure 11.2 shows Childhood Immunization Status (Combo 10) rates by Hispanic ethnicity. The Unknown ethnicity had the highest rate of childhood immunization status and this rate was significantly above the MHCP statewide rate, as well as the rates for Non-Hispanic ethnic groups. The rate for Hispanics was also significantly higher than the statewide MHCP rate. The Non-Hispanic ethnic group had the lowest rate.

Figure 11.2: Childhood Immunization Status (Combo 10) Statewide Rates by Hispanic Ethnicity

Controlling High Blood Pressure

Figure 12.1 shows the Controlling High Blood Pressure rates by race. The Multi-Racial racial group had the highest rate (78 percent). The Black or African American racial group had the lowest performance rate and this was significantly below the MHCP statewide rate.

Figure 12.1: Controlling High Blood Pressure Statewide Rates by Race

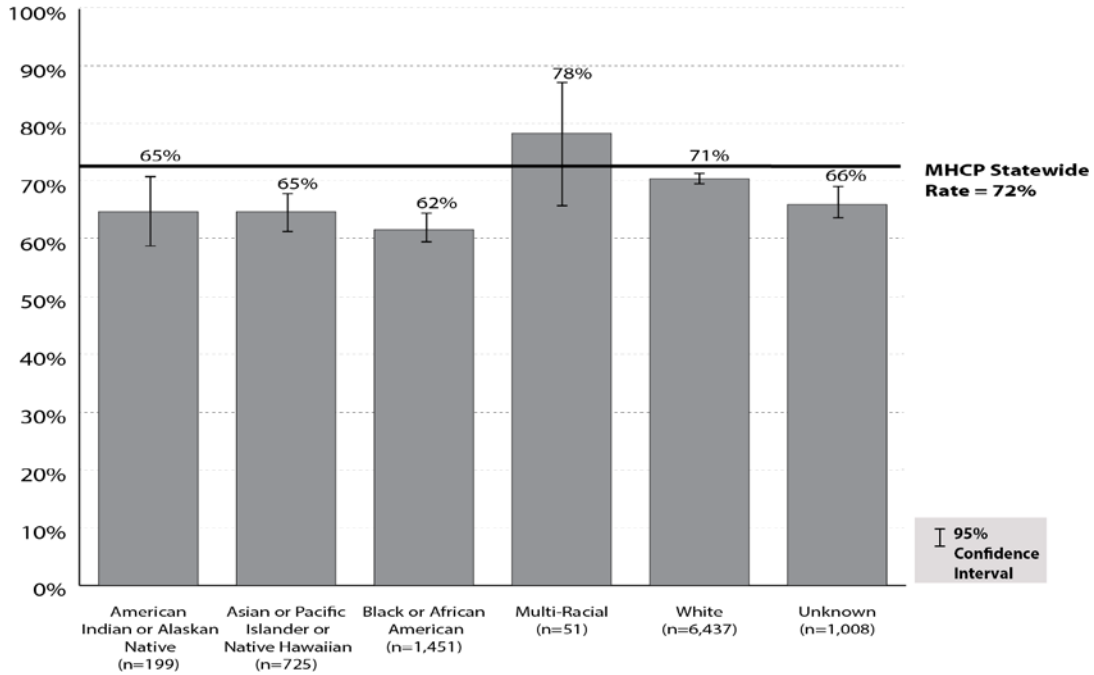

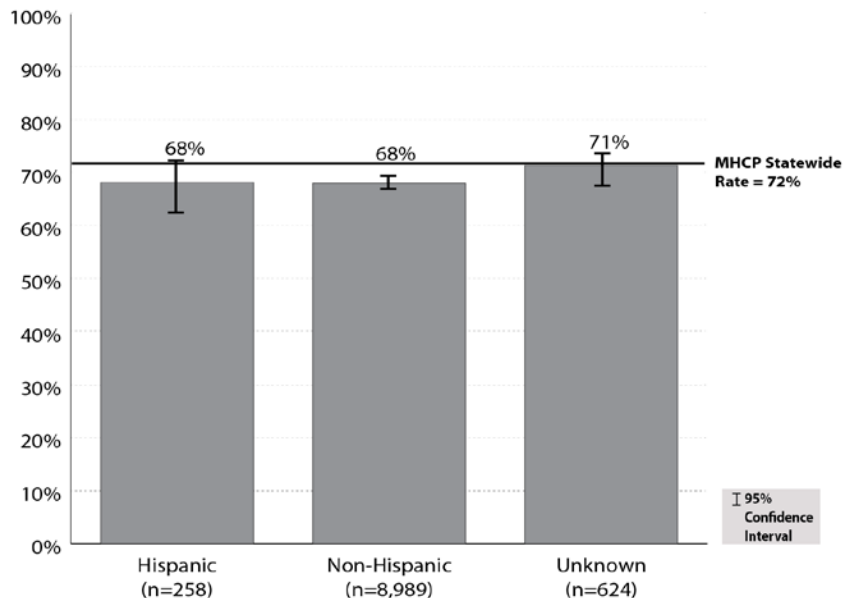

Figure 12.2 shows the rates of Controlling High Blood Pressure by Hispanic ethnicity. The Unknown ethnicity category had the highest rate of controlling high blood pressure; however, no ethnicity had rates significantly above the statewide average.

Figure 12.2: Controlling High Blood Pressure Statewide Rates by Hispanic Ethnicity

Chlamydia Screening in Women

Figure 13.1 shows Chlamydia Screening in Women rates by race. The Black or African American racial group continued to have the highest chlamydia screening rate, and it was significantly higher than the statewide MHCP rate (56 percent) and the rates for all other racial groups. The Asian or Pacific or Native Hawaiian and Multi-Racial groups were the only other groups with rates significantly above the MHCP statewide rate. The White racial group had the lowest chlamydia screening rate at 51 percent and the only rate that was significantly below the MHCP statewide rate.

Figure 13.1: Chlamydia Screening in Women Statewide Rates by Race

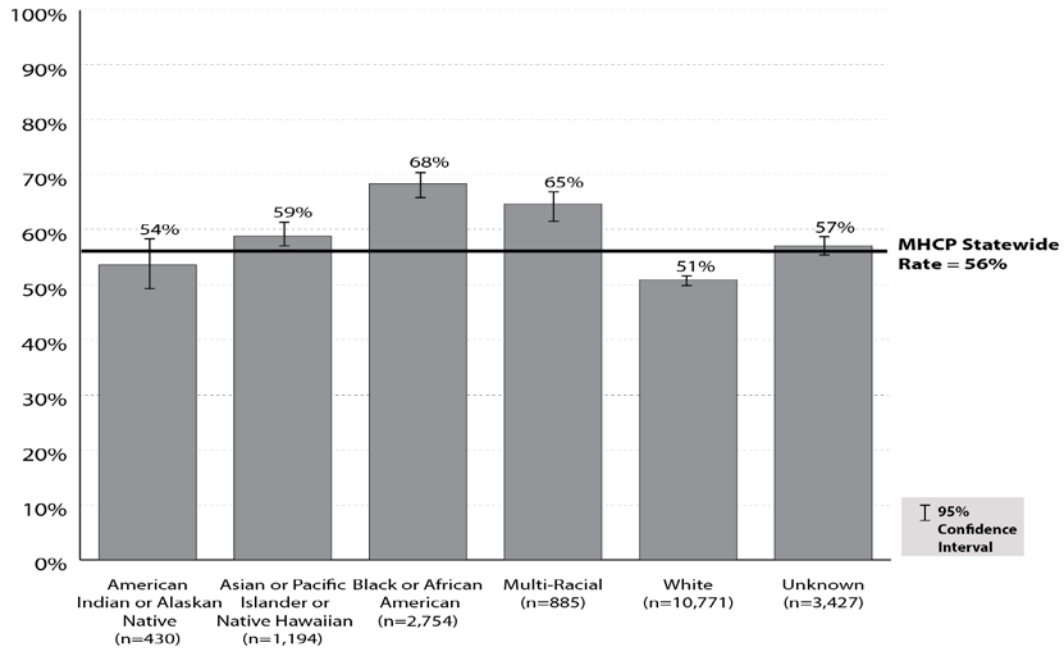

Figure 13.2 shows Chlamydia Screening in Women rates by Hispanic ethnicity. The Hispanic group had a highest rate of chlamydia screening and this was significantly above the MHCP statewide rate. The Unknown ethnicity category had the lowest performance rate.

Figure 13.2: Chlamydia Screening in Women Statewide Rates by Hispanic Ethnicity

Appropriate Treatment for Children with URI

Figure 14.1 shows Appropriate Treatment for Children with URI rates by race. The Black or African American racial group had the highest rate of appropriate treatment for children with URI (95 percent), and this rate was significantly above the MHCP statewide rate (93 percent). The Asian or Pacific Islander or Native Hawaiian and Unknown racial groups also had rates significantly above the MHCP statewide rate. The White racial group had the lowest rate at 91% and continued to have a performance rate significantly below the statewide MHCP rate.

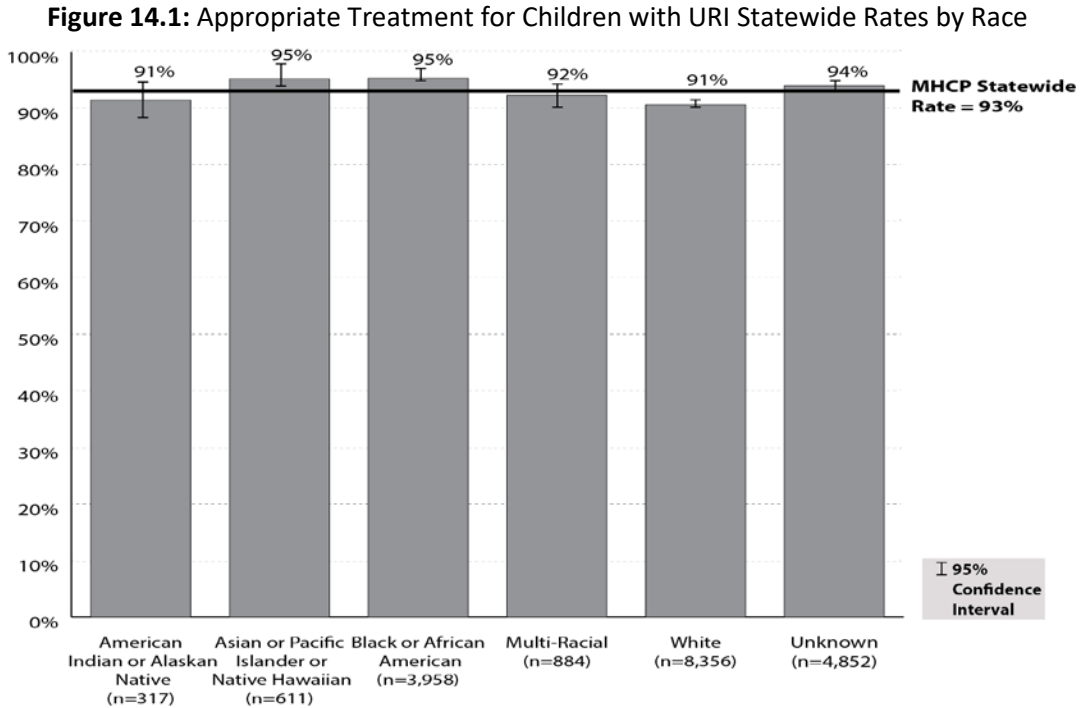

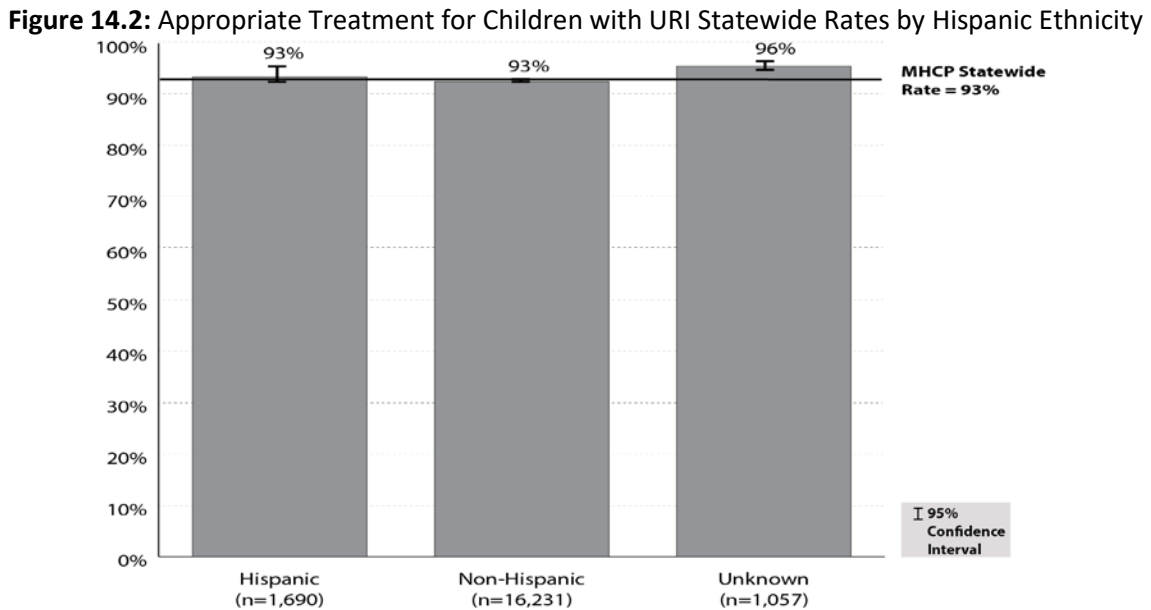

Figure 14.2 shows Appropriate Treatment for Children with URI rates by Hispanic ethnicity. The Unknown ethnicity category has the highest rate of appropriate treatment, and this rate was significantly above the MHCP statewide rate. Non-Hispanics had the lowest performance rate at 93 percent.

Breast Cancer Screening

Figure 15.1 shows the rates of Breast Cancer Screening by race. The White racial group had the highest rate of breast cancer screening, and this rate was significantly above the MHCP statewide rate (61 percent). The White racial group was the only group with a rate significantly above the MHCP statewide rate at 62 percent. The American Indian or Alaskan Native racial group had the lowest rate of breast cancer screening, and this rate was significantly below the MHCP statewide rate. The Black or African American racial group also had a rate significantly below the MHCP statewide rate at 56 percent.

Figure 15.1: Breast Cancer Screening Statewide Rates by Race

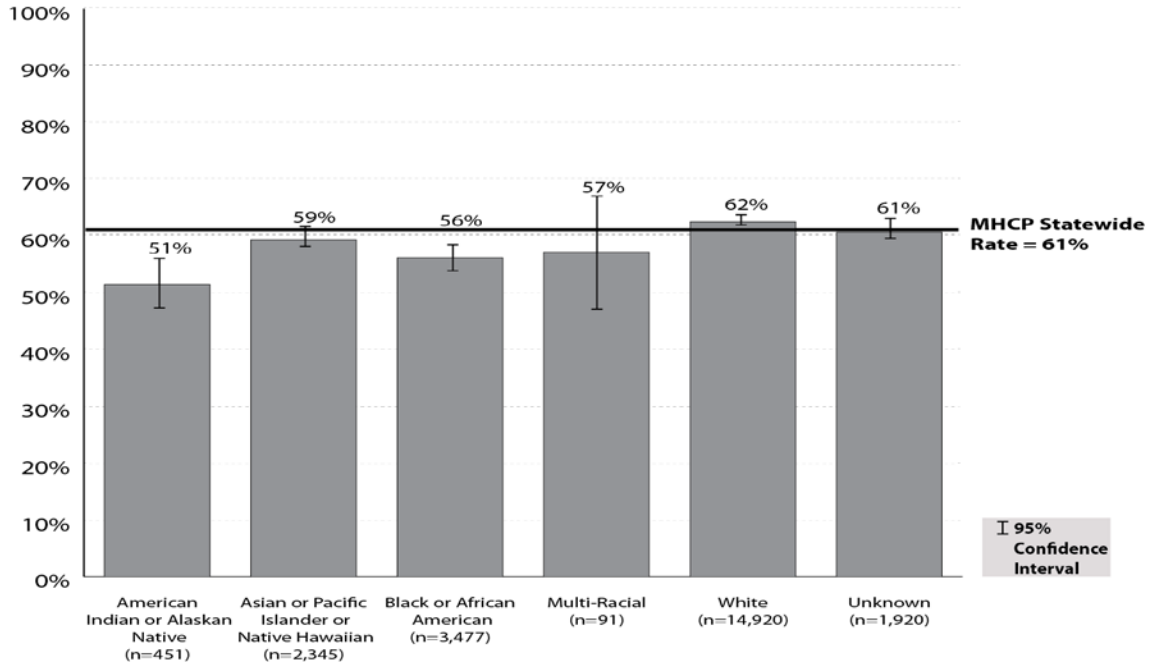

Figure 15.2 shows the rates of Breast Cancer Screening by ethnicity. Hispanics had the highest rate of breast cancer screening (69 percent), and this rate was significantly above the statewide MHCP rate, the Non-Hispanic rate, and the Unknown ethnicity rate. The rate for the Unknown ethnicity category was the lowest and this was significantly below the rate for Hispanics and Non-Hispanics, as well as the statewide MHCP rate.

Figure 15.2: Breast Cancer Screening Statewide Rates by Hispanic Ethnicity

Summary of Findings by Race

For each measure below, **Table 12** compares each racial group’s statewide average to the overall statewide MHCP average as being either significantly above, significantly below or similar to the statewide MHCP average. Statistical significance was determined using 95% confidence intervals.

Table 12: Summary of Findings by Racial Group

Measures/Racial Group	American Indian or Alaskan Native	Asian or Pacific Islander or Native Hawaiian	Black or African American	Multi-Racial	White	Unknown
Appropriate Treatment for Children with Upper Respiratory Infection		↑	↑		↓	↑
Childhood Immunization Status (Combo 10)	↓	↑	↓			↑
Controlling High Blood Pressure	↓	↓	↓		↓	
Breast Cancer Screening	↓		↓		↑	
Chlamydia Screening for Women		↑	↑	↑	↓	

↑ = Above MHCP Statewide Average
 ↓ = Below MHCP Statewide Average
 BLANK = Similar to MHCP Statewide Average

American Indian or Alaskan Native

The American Indian or Alaskan Native racial group had the lowest rate for two measures: Breast Cancer Screening and Childhood Immunization Status (Combo 10). There were no measures where the American Indian or Alaskan Native racial group had the highest rate.

There were three measures (Breast Cancer Screening, Childhood Immunization Status - Combo 10 and Controlling High Blood Pressure) where the American Indian or Alaskan Native racial group's rate was significantly lower than the MHCP statewide rate. There were no measures where this group's rate was significantly higher than the MHCP statewide rate.

Asian or Pacific Islander or Native Hawaiian

The Asian or Pacific Islander or Native Hawaiian racial group had the highest rate for the Childhood Immunization Status – Combo 10 measure. There were no measures where this group had the lowest rate.

There were three measures (Appropriate Treatment for Children with URI, Childhood Immunization Status – Combo 10 and Chlamydia Screening in Women) where this group's rate was significantly higher than the MHCP statewide rate. For one measure (Controlling High Blood Pressure), their rate was significantly lower than the MHCP statewide rate.

Black or African American

There were two measures where the Black or African American racial group had the highest rates: Appropriate Testing for Children with URI and Chlamydia Screening in Women. They had the lowest rate for the Controlling High Blood Pressure measure.

For two measures (Appropriate Treatment for Children with URI and Chlamydia Screening in Women), the Black or African American racial group had a performance rate significantly above the MHCP statewide rate; and for three measures (Breast Cancer Screening, Childhood Immunization Status - Combo 10 and Controlling High Blood Pressure) this racial group had a performance rate significantly below the MHCP statewide rate.

Multi-Racial

The Multi-Racial group had the highest rate for the Controlling High Blood Pressure measure. They did not have the lowest rate for any measure.

There was one measure (Chlamydia Screening in Women) where the Multi-Racial group had a performance rate significantly above the MHCP statewide rate. There were no measures where they had a significantly lower rate than the MHCP statewide rate.

White

The White racial group had the highest rate for the Breast Cancer Screening measure. The White racial group had the lowest rate for Appropriate Treatment for Children with URI and Chlamydia Screening in Women.

For one measure (Breast Cancer Screening), the White racial group had a performance rate that was significantly above the MHCP statewide rate. For three measures (Appropriate Treatment for Children with URI, Chlamydia Screening in Women and Controlling High Blood Pressure) the White racial group had a performance rate significantly below the MHCP statewide rate.

Unknown

The Unknown racial group did not have the highest or lowest rate for any measures.

There were no measures where the rate for the Unknown racial group was significantly below the MHCP statewide rate. For two measures (Appropriate Testing for Children with URI and Childhood Immunization Status – Combo 10), this racial group had a performance rate significantly above the MHCP statewide rate.

Summary of Findings by Hispanic Ethnicity

For each measure below, **Table 13** compares each Hispanic ethnicity group’s statewide average to the overall statewide MHCP average as being either significantly above, significantly below or similar to the statewide MHCP average. Statistical significance was determined using 95% confidence intervals.

Table 13: Summary of Findings by Hispanic Ethnicity Group

Measures/Ethnic Group	Hispanic	Non-Hispanic	Unknown
Appropriate Treatment for Children with Upper Respiratory Infection			↑
Childhood Immunization Status (Combo 10)	↑	↓	↑
Controlling High Blood Pressure		↓	
Breast Cancer Screening	↑		↓
Chlamydia Screening in Women	↑		

↑ = Above MHCP Statewide Average
 ↓ = Below MHCP Statewide Average
 BLANK = Similar to MHCP Statewide Average

Hispanic

For two measures (Chlamydia Screening in Women and Breast Cancer Screening), Hispanics had the highest performance rate. There were no measures where they had the lowest rate. For three measures (Childhood Immunization Status - Combo 10), Chlamydia Screening in Women and Breast Cancer Screening), the performance rates for Hispanics were significantly above the MHCP statewide rate. There were no measures where Hispanics had a performance rate significantly below the MHCP statewide rate.

Non-Hispanic

There were no measures where Non-Hispanics had the highest performance rate. There were three measures (Appropriate Treatment for Children with URI, Controlling High Blood Pressure, and Childhood Immunization Status - Combo 10) where Non-Hispanics had the lowest rates. There were two measures (Childhood Immunization Status - Combo 10 and Controlling High Blood Pressure) where the Non-Hispanics had a performance rate significantly below the MHCP statewide rate.

Unknown

For three measures (Appropriate Treatment for Children with URI, Childhood Immunization Status – Combo 10 and Controlling High Blood Pressure), the Unknown ethnic group had the highest rates. There were two measures (Chlamydia Screening in Women and Breast Cancer Screening) where the Unknown ethnic group had the lowest rates. For two measures (Appropriate Treatment for Children with URI and Childhood Immunization Status – Combo 10), they had performance rates significantly higher than the MHCP statewide rate. There was one measure (Breast Cancer Screening) where the Unknown ethnic group had rates significantly below the MHCP statewide rate.

Limitations related to Race/Ethnicity Data

This report includes statewide comparisons by racial and Hispanic ethnicity groups. A minimum of 30 MHCP patients is required to report rates by racial and Hispanic ethnicity group at statewide and medical group levels. Very few medical groups met this minimum reporting threshold, which is necessary for comparisons by race and Hispanic ethnicity across medical groups. As a result, this report does not include medical group rates by race and Hispanic ethnicity.

To be included in a HEDIS measure, a patient must meet specified continuous enrollment criteria. Continuous enrollment in a health plan defines a sufficient timeframe during which a health care service could be performed.

A shorter enrollment period makes it less likely that a health care service would be rendered. MHCP patients often have multiple interruptions in enrollment due to events such as the loss of MHCP eligibility. Since MHCP patients who are represented in HEDIS measures are only those with continuous enrollment, the measure may not reflect the experience of all MHCP patients. When HEDIS performance rates are further calculated by race and Hispanic ethnicity, as reported above for the MHCP population, the continuous enrollment criteria may also impact some racial groups more than others. It is important for medical groups and clinics to be aware of the impact that continuous enrollment has on HEDIS measure results in general and for each racial and Hispanic ethnicity group.

Please see next page.

An Examination of Statewide MHCP Performance Rates by DHS Region

Statewide results showed variation in performance among the different geographic regions in Minnesota.

Methods

Statewide comparisons by region were conducted on the MHCP patient population using enrollment data supplied by the Minnesota Department of Human Services (DHS). DHS sends monthly enrollment data to the health plans it contracts with to provide health care services to MHCP patients. Each patient was placed into one of four geographic regions of the state based on the county location of the clinic where they received care at during the measurement period.

Region Descriptions

- Northwest region: The counties in this region include: Becker, Beltrami, Clay, Clearwater, Douglas, Grant, Hubbard, Kittson, Lake of the Woods, Mahnomen, Marshall, Norman, Otter Tail, Pennington, Polk, Pope, Red Lake, Roseau, Stevens, Traverse and Wilkin.
- Northeast region: The counties in this region include: Aitkin, Benton, Carlton, Cass, Chisago, Cook, Crow Wing, Isanti, Itasca, Kanabec, Koochiching, Lake, Mille Lacs, Morrison, Pine, Sherburne, St. Louis, Stearns, Todd, Wadena and Wright.
- Metro region: The counties in this region include: Anoka, Carver, Dakota, Hennepin, Ramsey, Scott and Washington.
- Southern region: The counties in this region include: Big Stone, Blue Earth, Brown, Chippewa, Cottonwood, Dodge, Faribault, Fillmore, Freeborn, Goodhue, Houston, Jackson, Kandiyohi, Lac qui Parle, Le Sueur, Lincoln, Lyon, Martin, McLeod, Meeker, Mower, Murray, Nicollet, Nobles, Olmstead, Pipestone, Redwood, Renville, Rice, Rock, Sibley, Steele, Swift, Wabasha, Waseca, Watonwan, Winona and Yellow Medicine.

Colorectal Cancer Screening

Figure 16 shows the rates of Colorectal Cancer Screening by DHS region. MHCP patients had the highest screening rate for colorectal cancer in the Northeast and Southern regions (57 percent), and these rates were significantly above the MHCP statewide rate (56 percent). Only the Metro region (55 percent) had a screening rate significantly below the MHCP statewide rate.

Figure 16: Colorectal Cancer Screening Rates by DHS Region

Depression Remission at Six Months

Figure 17 shows the rates of Depression Remission at Six Months by DHS region. The percentage of MHCP patients who experienced depression remission at six months was highest in the Northeast region (six percent) and this rate was statistically above the MHCP statewide rate (five percent). The Southern region had the lowest rate at four percent and it was the only rate significantly below the MHCP statewide rate.

Figure 17: Depression Remission at Six Months Rates by DHS Region

Optimal Diabetes Care

Figure 18 shows the rates of Optimal Diabetes Care by DHS region. The Southern region had the highest rate of optimal care (34 percent) and this was significantly above the MHCP statewide rate (33 percent). The Metro region (33 percent) also had a rate that was significantly above the MHCP statewide rate. The lowest rate was found in the Northwest region at 29 percent and this rate was significantly below the MHCP statewide rate, along with the Northeast region at 30 percent.

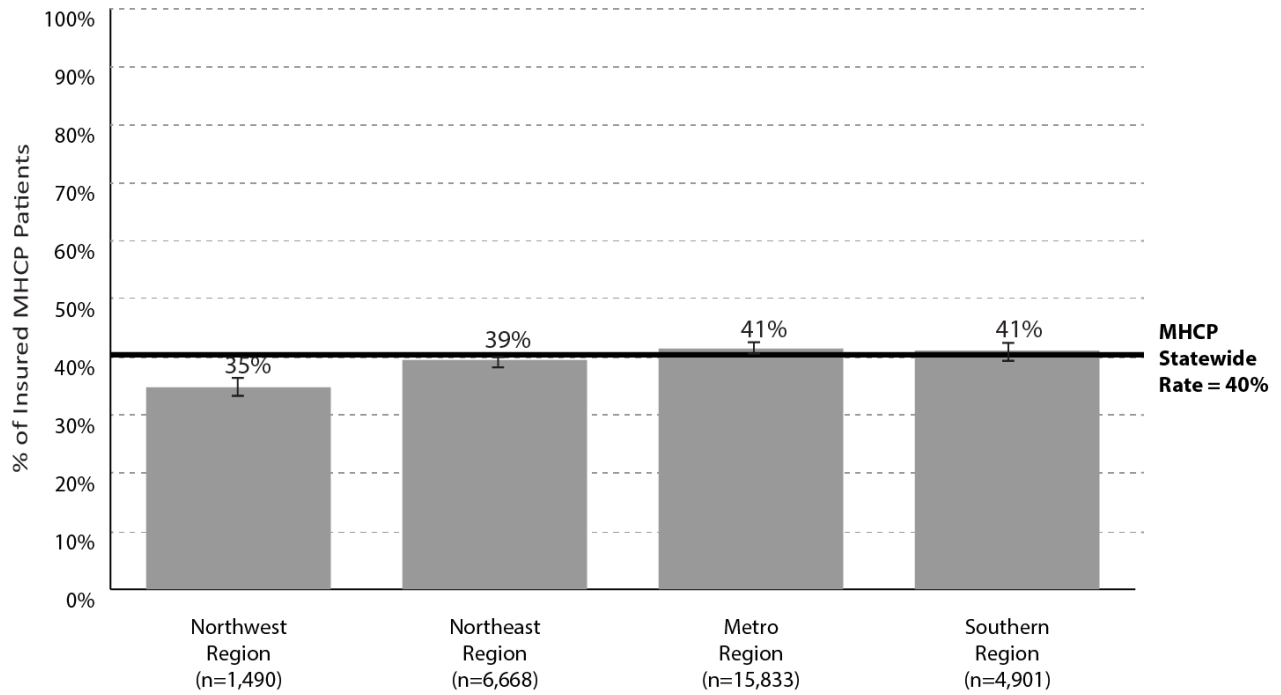

Figure 18: Optimal Diabetes Care Rates by DHS Region

Optimal Asthma Control – Adults Ages 18-50

Figure 19 shows the rates of Optimal Asthma Control – Adults Ages 18-50 by DHS region. The Metro region had the highest rate (41 percent), and this rate was significantly above the MHCP statewide rate (40 percent). The lowest rate was found in the Northwest region at 35 percent and this rate was significantly below the MHCP statewide rate, along with the Northeast region at 39 percent.

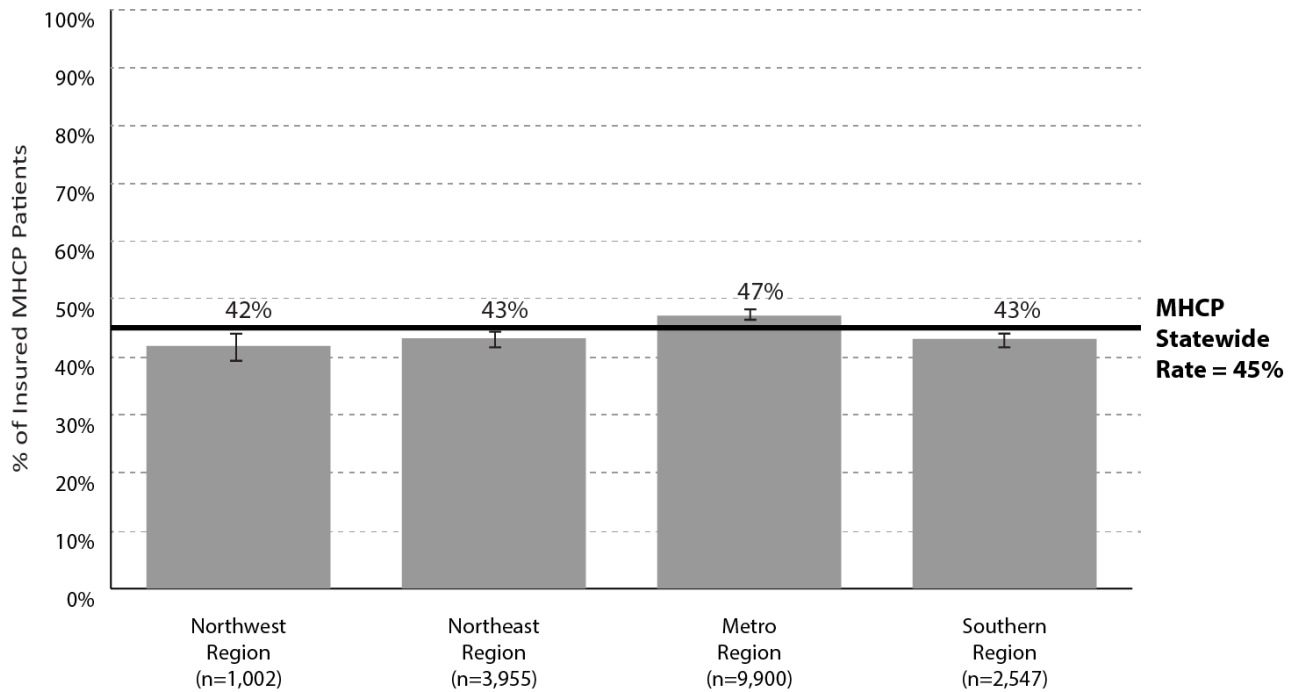

Figure 19: Optimal Asthma Control – Adults Ages 18-50 Rates by DHS Region

Optimal Vascular Care

Figure 20 shows the rates of Optimal Vascular Care by DHS region. The Metro region had the highest rate (47 percent) and this rate was significantly above the MHCP statewide rate (45 percent). The lowest rate was found in the Northwest region at 42 percent. The rates for the Northwest, Northeast, and Southern regions were all significantly below the MHCP statewide rate.

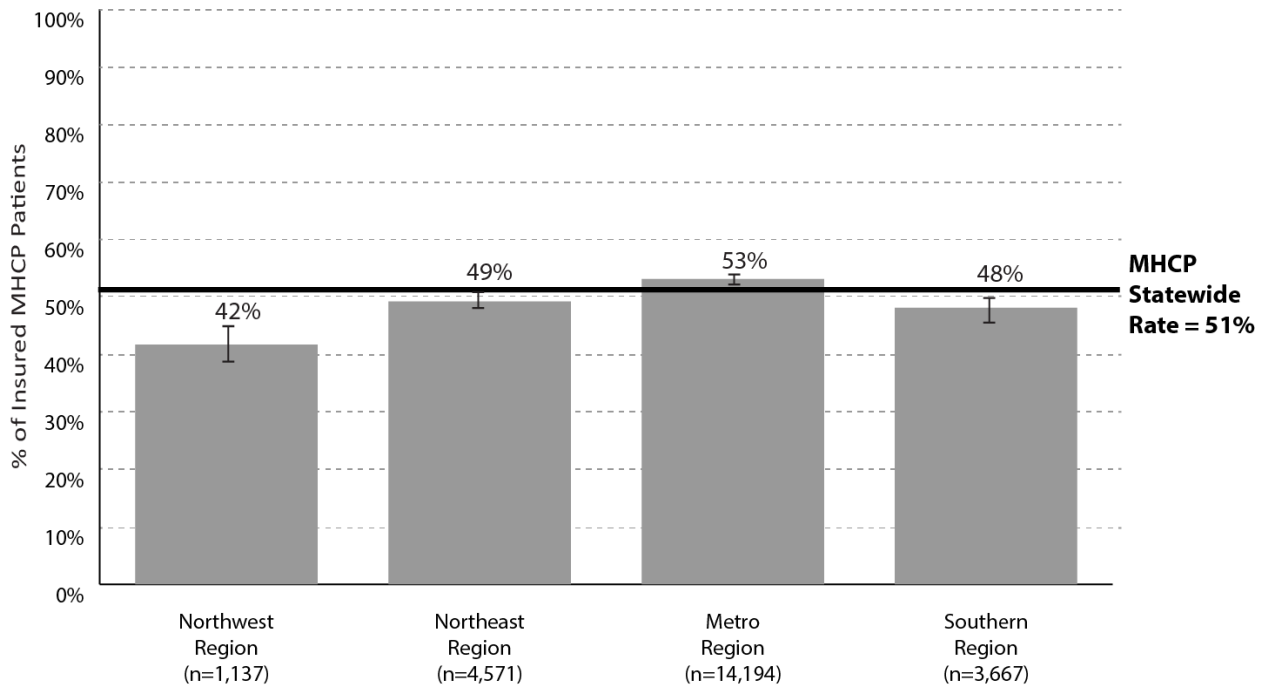

Figure 20: Optimal Vascular Care Rates by DHS Region

Optimal Asthma Control – Children Ages 5-17

Figure 21 shows the rates of Optimal Asthma Control – Children Ages 5-17 by DHS region. The Metro region had the highest rate (53 percent), and this rate was significantly above the MHCP statewide rate (51 percent). The lowest rate was found in the Northwest region at 42 percent; the rates for the Northwest, Northeast, and Southern regions were all significantly below the MHCP statewide rate.

Figure 21: Optimal Asthma Control – Children Ages 5-17 Rates by DHS Region

Summary of Findings by DHS Region

For each measure below, **Table 14** compares each regional group’s statewide average to the overall statewide MHCP average as being either significantly above, significantly below or similar to the statewide MHCP average. Statistical significance was determined using 95% confidence intervals.

Table 14: Summary of Findings by Region

Measures/DHS Region	Northwest Region	Northeast Region	Metro Region	Southern Region
Optimal Diabetes Care	↓	↓	↑	↑
Optimal Vascular Care	↓	↓	↑	↓
Depression Remission at Six Months		↑		↓
Optimal Asthma Control - Children Ages 5-17	↓	↓	↑	↓
Optimal Asthma Control - Adults Ages 18-50	↓	↓	↑	
Colorectal Cancer Screening		↑	↓	↑

↑ = Above MHCP Statewide Rate
 ↓ = Below MHCP Statewide Rate
 Blank = Similar to MHCP Statewide Rate

The Northwest Region

The Northwest region had the lowest rate for four of the six measures: Optimal Diabetes Care, Optimal Vascular Care, Optimal Asthma Control – Children Ages 5-17, and Optimal Asthma Control – Adults Ages 18-50. All of these rates were significantly below the MHCP statewide rate.

There were no measures where this region's rate was significantly above the MHCP statewide rate.

The Northeast Region

The Northeast region had the highest rate for two measures: Depression Remission at Six Months and Colorectal Cancer Screening. The Northeast region did not have the lowest rate for any measure.

For two measures (Depression Remission at Six Months and Colorectal Cancer Screening), this region had a performance rate significantly above the MHCP statewide rate. Conversely, the Northeast region had a performance rate significantly below the MHCP statewide rate for four measures: Optimal Diabetes Care and Optimal Vascular Care, Optimal Asthma Control – Children Ages 5-17 and Optimal Asthma Control – Adults Ages 18-50.

The Metro Region

There were three measures where the Metro region had the highest rate: Optimal Vascular Care, Optimal Asthma Control – Children Ages 5-17, and Optimal Asthma Control – Adults Ages 18-50. There was one measure (Colorectal Cancer Screening) where this region had the lowest rate.

For four measures (Optimal Diabetes Care, Optimal Vascular Care, Optimal Asthma Control – Adults Ages 18-50, and Optimal Asthma Control – Children Ages 5-17), the Metro region had a performance rate significantly above the MHCP statewide rate. For one measure (Colorectal Cancer Screening), this region also had a significantly lower performance rate than the MHCP statewide rate.

The Southern Region

The Southern region had the highest performance rate for one measure: Optimal Diabetes Care. This region had the lowest rate for the Depression Remission at Six Months measure.

There were two measures (Optimal Diabetes Care and Colorectal Cancer Screening) where the Southern region had a performance rate significantly above the MHCP statewide rate. There were three measures (Depression Remission at Six Months, Optimal Vascular Care, and Optimal Asthma Control – Children Ages 5-17) where this region had a rate significantly below the MHCP statewide rate.

Conclusion

The *2017 Health Care Disparities Report for Minnesota Health Care Programs* spotlights that MHCP performance rates are improving for some measures, but declining for other measures. Progress in addressing disparities can be seen most notably by improved health outcomes for two measures and narrowing of the gap between purchasers for six measures. But setbacks can also be seen for eight measures where performance rates decreased for MHCP patients, and for four measures where the gap between MHCP and Other Purchasers patients widened.

The results of this report highlight that there is still significant room for improvement to reduce health care disparities and close the gaps. Inequities within our health care system continue to exist and are unacceptable. This report shows it is possible for medical groups and clinics to achieve optimal health outcomes for all patients regardless of their socioeconomic status. We are finding that more and more medical groups are using information from this report to benchmark progress and make improvements.

Overall, we continue to see statewide gaps between care received by MHCP patients and Other Purchasers patients. Gaps widened this year for four measures (Appropriate Treatment for Children with URI, Depression Remission at Six Months, Optimal Vascular Care, and Breast Cancer Screening) and these differences were statistically significant. Conversely, gaps between purchasers narrowed significantly for four measures (Chlamydia Screening in Women, Controlling High Blood Pressure, Optimal Asthma Control – Adults Ages 18-50, and Colorectal Cancer Screening).

Differences between race and Hispanic ethnicity were found for every measure within the MHCP patient population. Performance rates for the Black or African American racial group continued to be low compared to other racial groups for several measures; however, rates for Black or African Americans were significantly above the statewide MHCP rate for two measures. Hispanic patients had rates that were significantly above the statewide MHCP rate for three measures.

This report features MHCP regional rates for the six DDS measures. This analysis was included to provide more information about the health outcomes of MHCP patients in various regions in Minnesota. There were noteworthy performance differences in MHCP rates for each measure by region. The Metro region had above average rates for four measures. Conversely, the Northwest region had the lowest rate for four measures, and all rates were significantly below the MHCP statewide rate.

Improving health outcomes for all patients requires a thorough examination of performance data at a medical group or clinic level, in addition to statewide and national levels. The public reporting of health care performance rates can drive quality improvement, particularly when rates are reported at a level where more accountability lies and actions to address disparities are more likely to have an effect.

While data alone will not reduce disparities, it is an important tool for identifying improvement opportunities and assessing progress. The information in this report can be useful to policy makers, public health professionals, communities of color, and health care systems to support focused improvement efforts. Much work remains to ensure MHCP patients achieve the same health care outcomes as Other Purchaser patients.

Appendix 1: Data Sources and Data Collection

Administrative and Hybrid Measures

Data used for the administrative and hybrid measures originated from health plan administrative claims databases. Hybrid measures were supplemented by medical record review. Data elements were specified by HEDIS 2017 Technical Specifications (2016 dates of service). HEDIS is produced and maintained by the National Committee for Quality Assurance (NCQA). The technical specifications provided detailed steps and instructions to ensure that the submitted data met rigorous standards.

The data elements were collected by the health plans using the HEDIS technical specifications that followed the annual HEDIS calendar. In addition, each health plan's data were subjected to extensive validation processes to ensure quality measures followed the standards described in Volume 5, HEDIS Compliance Audit®: Standards, Policies and Procedures. All health plan data were audited by a NCQA-certified HEDIS auditor.

MNCM developed a data structure document with detailed steps and instructions to ensure data were submitted in a consistent way. In 2017, 10 data sources – Blue Cross and Blue Shield of Minnesota, HealthPartners, Hennepin Health, Itasca Medical Care, Medica, PreferredOne, PrimeWest Health System (county-based purchaser), Sanford Health Plan, South Country Health Alliance (county-based purchaser) and UCare – submitted data to MNCM. The submitted data reflects patients/members enrolled in the following products: commercial HMO/POS/ PPO, Medicare Cost, Medicare Risk, and Minnesota Health Care Programs (pre-paid Medical Assistance including dual eligibles and MinnesotaCare). Administrative and hybrid measures did not include patients who were uninsured, who self-paid, or patients who were served by Medicaid/Medicare Fee-for-Service.

All health plan data files were submitted to MNCM for aggregation, validation and public reporting. An independent vendor under contract with MNCM conducted the aggregation and validation processes. Each health plan file was carefully reviewed to ensure conformance with the data structure and identify unusual or unanticipated patterns. The files were also checked for proper formatting, missing and invalid values, and to confirm accurate record counts. Preliminary health plan rates were calculated and returned to each health plan for additional validation.

Once the file validation checks were finalized, the data files from all 10 health plans were aggregated to create a comprehensive data file of results by medical group. The aggregated data file was then checked for accurate record counts and preliminary measure rates were calculated. The preliminary rates were carefully reviewed by MNCM staff and the data aggregation vendor. Particular attention was paid to notable changes from previous years at the statewide and medical group levels. After these checks were finalized, preliminary rates were compiled into the *2017 Health Care Disparities Report* and sent to DHS and medical groups for review and comment. Any data concerns identified were reviewed to determine if the issues were related to the submitted data.

Direct Data Submission Measures

The data source of clinic level results was the clinics themselves. All data elements were specified by MNCM in the 2017 Direct Data Submission (DDS) Guides (2016 dates of service). These guides provided detailed steps and instructions to ensure that data were submitted in a consistent way.

Data for DDS measures were reported at two levels: by clinic site and medical group. Clinics were defined as single sites where patients received care. Medical groups generally consisted of multiple clinic sites. Often, medical groups provide centralized administrative functions for several clinic sites.

Medical groups/clinics that submitted data for individual clinics first registered through the MNCM Data Portal. Once registered, they had the option to submit data on a clinic's total patient population or for a representative sample of the clinic's total patient population. Detailed instructions for sampling were provided in the DDS guides. Medical

groups/clinics that submitted data through this process were required to submit data for all clinics within the medical group.

Clinic abstractors collected data from medical records either by extracting the data from electronic medical records through a data query or abstracting the data from paper-based medical records. Medical groups completed numerous quality checks before data were submitted to MNMCM. All appropriate HIPAA requirements were followed.

Medical groups/clinics submitted the required data elements directly through the MNMCM Data Portal. Once data were submitted, an extensive validation process was followed which included quality checks of all files and on-site audits for selected clinics. For on-site audits, MNMCM used NCQA's "8 and 30" File Sampling Procedure, developed in 1996 in consultation with Johns Hopkins University. For a detailed description of this procedure, go to ncqa.org. Audits were conducted by MNMCM staff and/or contracted auditors who were independent of medical groups and/or clinics. Validation is critical to ensure the data are reliable, complete and consistent.

Appendix 2: Methods

Measures reported

Three types of measures were reported at the medical group level: measures that used an administrative data only method submitted by the health plans, measures that used a hybrid method (administrative claims data plus medical record review) submitted by the health plans and measures that used data submitted directly to MNMCM by medical groups and clinics from electronic health records or paper-based medical charts.

The following HEDIS measures used the hybrid method (referenced in Appendix 1):

- Childhood Immunization Status (Combo 10)
- Controlling High Blood Pressure

The following HEDIS measures used data submitted by the health plans using the administrative method (referenced in Appendix 1):

- Appropriate Treatment for Children with Upper Respiratory Infection (URI)
- Breast Cancer Screening
- Chlamydia Screening in Women

The following measures used data submitted directly to MNMCM by medical groups and clinics (referenced in Appendix 1):

- Optimal Diabetes Care
- Optimal Vascular Care
- Depression Remission at Six Months
- Optimal Asthma Control - Children Ages 5-17
- Optimal Asthma Control - Adults Ages 18-50
- Colorectal Cancer Screening

Each year, these measure specifications are reviewed against current evidence-based guidelines. Specifications for measures that use the hybrid and administrative method were calculated using NCQA's 2017 HEDIS Technical Specifications. Specifications for DDS measures were calculated in the MNMCM Data Portal using MNMCM's 2017 DDS Guide and Technical Specifications.

Eligible Population Specifications

The eligible populations for the administrative and hybrid HEDIS measures were identified by each participating health plan utilizing its respective administrative databases. NCQA's 2017 HEDIS Technical Specifications provided the standard definitions for the eligible population for each measure, which included data elements such as age, continuous enrollment and anchor date requirements.

The eligible populations for the measures reported directly to MNMCM by medical groups and clinics were identified by a medical group on behalf of their individual clinics. MNMCM's 2017 DDS Guide and Technical Specifications provided the standard definitions for the eligible population for each measure, which included elements such as age, appropriate diagnosis codes, number of visits needed in the measurement timeframe, and established patient criteria. For administrative measures, the entire eligible population was the denominator. For hybrid measures, the eligible population served as the sampling frame from which to draw the number of patients for chart audit and the reference for weighting.

Patient Attribution to Medical Groups/Clinics

Health plans assigned patients to a medical group using frequency-based attribution logic and a standard medical group definition based on Tax Identification Numbers. Administrative billing codes determined the frequency of patient visits to medical groups. For most measures, patients were assigned to the medical group they visited most frequently during the measurement year. Patients who visited two or more medical groups with the same frequency were attributed to the medical group visited most recently in the measurement year. For one measure – Appropriate Treatment for Children with URI – patients were assigned to the clinic they visited for the specific service.

To submit data at the clinic level for the DDS measures, medical groups attributed each patient to a single clinic within their medical group. Each medical group's patient attribution method was defined by the medical group and was reviewed by MNMCM as part of the denominator certification process. Most patients were attributed to an assigned primary care provider. Some patients were attributed to the provider who saw the patient most often or most recently in the measurement year.

Sampling Method for Hybrid HEDIS Measures

As previously noted, the hybrid method required each participating health plan to first identify the eligible population meeting measurement specifications using its administrative databases. This population of eligibles served as the sampling frame from which to draw the denominator (the patients for whom medical record review would be completed). The resource-intensive nature of medical record review necessitated pulling a random sample of the eligible population for medical record review. This review was conducted for all enrollees drawn for the sample.

MNCM used a two-stage, random sampling process. This strategy was designed with statisticians to ensure reporting for the maximum number of medical groups while minimizing the impact of weighting on the results for any one medical group. The sampling procedure began with each health plan providing a data file containing a record for each eligible patient for each hybrid measure. This file also identified eligible patients that had been selected for the annual HEDIS sample. Additional patients were then selected from the remaining eligible population to meet MNMCM minimum reporting requirements.

Sampling Method for Measures Collected by Direct Data Submission

Medical groups could submit data on their full population or a sample of at least 60 patients per clinic, but were strongly encouraged to submit their total population of patients. For medical groups that chose to submit a sample, the 2017 DDS Guide described accepted methods to select a systematic sample. This step was reviewed by MNMCM as part of the denominator certification process. In 2017, about 99 percent of clinics for Optimal Diabetes Care; 100 percent of clinics for Optimal Vascular Care; 100 percent of clinics for Optimal Asthma Control – Children Ages 5-17; 100 percent of clinics for Optimal Asthma Control – Adults Ages 18-50; and about 93 percent of clinics for Colorectal Cancer Screening submitted their total population of patients. For Depression Remission at Six Months, clinics were required to submit their total population.

Numerator Specifications

For administrative measures, the numerator was the number of patients from the eligible population who met numerator targets. For hybrid measures, the numerator was the number of patients from the sample who met numerator targets. For DDS measures, the numerator was the number of patients identified from either the eligible population or the sample who meet the numerator targets. The targets were specified by MNMCM in the DDS Guide and compliance with these specifications was audited.

Weighting for Hybrid Measures

Because data for the hybrid measures were taken from a sample, results were weighted to obtain accurate rates. This allowed for aggregation and unbiased reporting by medical group. Weighting enabled MNMCM to draw a sample on which to estimate medical group and statewide rates. Weighting was applied to efficiently utilize health plan resources for data collection on a randomly sampled population. Weights were calculated for each sampling stratum (i.e., health

plan/health plan product/medical group). A weight was equal to the total eligible population for that stratum divided by the total sample size for that stratum. In calculating rates for a population (medical group or statewide) the denominator was the sum of the weights for all patients in that population, and the numerator was the sum of the weights for patients in the population who met the numerator targets.

Weighting for Measures Collected by Direct Data Submission

Data for the DDS measures were taken from a sample but only for clinics that elected to sample their total population. In those cases, results were weighted to account for the total population, thus allowing a performance rate to be calculated based on the complete census of all patients in the clinic. For Depression Remission at Six Months, clinics were required to submit their total population and thus the results are not weighted.

Calculating Rates for Administrative and Hybrid HEDIS Measures

Medical group level rates were expressed as percentages. They were calculated as 100 times the number who met the numerator targets divided by the number who were eligible for the measure. Rates calculated for measures using the administrative method were straightforward. However, rates calculated for measures using the hybrid method required weighting because of the sampling procedures. Rates and 95 percent asymmetrical confidence intervals were calculated for each measure for each medical group. Asymmetrical confidence intervals were used to avoid confidence interval lower-bound values less than zero and upper-bound values greater than 100. Medical group rates were first calculated for each group and then a medical group average was calculated. The medical group average was displayed when comparing medical group performance to provide context.

Calculating Rates for Measures Collected by Direct Data Submission

Clinic level rates were expressed as percentages. They were calculated as 100 times the number who met the numerator specifications divided by the number in the denominator for the measure. Rates calculated for measures using the total eligible population were straightforward calculations whereby the total eligible population served as the denominator. However, for clinics that elected to sample from their total population, the rates calculated for the measures required weighting to account for the total eligible population of the clinics. Due to the dynamic nature of clinic patient populations, rates and 95 percent confidence intervals were calculated for each measure for each clinic regardless of whether clinics submitted a full population or a sample. Clinic level rates were first calculated for each clinic and then a clinic average rate was calculated. The clinic average rate was displayed when comparing a single clinic to the performance of all clinics to provide context.

Assigning Payer Product Types for Measures Collected by Direct Data Submission

As part of MNMCM's DDS process, medical groups submitted data directly to MNMCM to calculate clinic-level performance rates. This information did not include payer product type. To calculate MHCP and Other Purchaser rates for DDS measures, information submitted via DDS was supplemented with information from health plans to obtain a patient's payer product type (e.g., commercial, Medicaid, Medicare). Working with representatives of medical groups and health plans, MNMCM developed a process to link DDS performance data to health plan enrollment data and appropriately assign product type per patient.

Limitations

The medical groups and clinics identified in this report do not represent all medical groups and clinics in Minnesota. MNMCM established minimum thresholds for public reporting to ensure statistically reliable rates. Only medical groups and clinics that met those thresholds were reported. Because hybrid measures are based on a sample, a higher threshold was used – 60 patients per medical group were required for public reporting to ensure a reasonable level of confidence in the reported rate. Administrative measures are based on a complete census of managed care patients, so a minimum threshold of 30 patients per medical group was required. DDS measures are based on complete census of all patients, regardless of payer, so a minimum threshold of 30 patients per clinic was required. It should also be noted that medical groups and clinics that were reported for one measure may not have been reported for all measures.

It is important to reiterate that data used to calculate rates for administrative and hybrid measures reflected patients insured through one of 10 health plans. Medical groups with patients who were insured through other health plans, who were uninsured, who self-paid, or who were served by a Medicaid/Medicare Fee-for-Service program were not reflected in these results. Therefore, the data for these measures may not have represented a medical group's entire patient population.

Caution is recommended when making comparisons from year to year. Annual rate differences can occur due to natural variation, changes in measurement specifications, changes in data sources and other unspecified factors.

Limitations and implications of using continuous enrollment criteria with MHCP patients

Continuous enrollment specifies the minimum amount of time that a patient must be enrolled in a health plan before he or she is eligible to be counted for a measure. Continuous enrollment criteria are used by health plans to ensure ample time for a patient to obtain health care services while enrolled. The purpose is to standardize the method of patient inclusion in a measure across all health plans and medical groups. When used as part of a measurement tool, continuous enrollment defines a sufficient timeframe during which a health care service could be performed. A shorter enrollment period makes it less likely for a health care service to be rendered and also makes it difficult for a health plan to respond to the needs of a patient.

Patients can have interruptions in enrollment with a health plan. These interruptions are referred to as "gaps in enrollment." During a gap, a patient does not have health insurance coverage, making it less likely for him/her to obtain health care services. Unfortunately, MHCP patients may have multiple gaps during a 12 month period due to events such as the loss of MHCP eligibility. For most HEDIS measures, a 45 day gap still allows a patient to be included in a measure; however, a study of the Medicaid population in Oregon demonstrated that these patients often have gaps that exceed 45 days.¹⁰ Since Medicaid patients (including those enrolled in MHCP) who are represented in HEDIS measures are only those with continuous enrollment, the measure results may not be reflective of the experience of all Medicaid/MHCP patients.

When performance rates are further calculated by race for the MHCP population, the continuous enrollment criteria magnifies the concern about representation. A review by DHS showed continuous enrollment criteria reduced the representation of some racial groups within a HEDIS measure, and some measures were impacted more than others. When designing quality improvement interventions targeting specific patient populations – particularly projects based on race – it will be important for medical groups and clinics to be aware of the impact that continuous enrollment has on HEDIS measures in general and for each racial group specifically. To work with a more representative population, an adjustment of the continuous enrollment criteria may be necessary depending on the measures selected.

Data Analyses

Identifying High-Performing Medical Groups/Clinics

For each measure, we calculated both individual medical group rates and a medical group average rate for MHCP patients. We identified medical groups that achieved high performance by comparing the individual medical group/clinic rate with the medical group/clinic average. Medical groups with high rates and 95 percent confidence intervals that were fully above the medical group average were noted as high performers. These high performers were highlighted in the "Results by Measure" section for each measure. The performance rates for all medical groups were presented by performance rate in descending order in Appendix 3. The same methods were performed at the clinic level for the DDS measures.

Identifying Medical Groups with Biggest Improvements

For each measure, we compared each individual medical group's rate during report year 2017 with their rate during report year 2016, and calculated a percentage point difference. Medical groups with the largest percentage point increases were highlighted.

Medical Group Performance over Time (Three Years)

For each measure, this analysis was done to determine patterns of medical group performance over time. Patterns were reviewed for the three reporting years (2015, 2016 and 2017). See “Medical Group Performance over Time (2015 to 2017)” in the “Results by Measure” section and Appendix 4 for detailed tables of medical groups.

Patterns in rate changes over the three reporting years (2015, 2016, and 2017) were reviewed. Only medical groups with rates for all three reporting periods per measure were included in the analysis. The analysis was defined as three reporting years to allow as many groups as possible to have three years of reported data and the opportunity to be included in the analysis. The percent and number of medical groups were reported for each of the following patterns of rate changes over the past three years for each measure:

- High performance and above average rates: Medical groups with a rate and confidence interval greater than the statewide average for each of the three years.
- Consistently improved: Medical groups with more than a two percentage point increase between each consecutive year.
- Relatively stable: Medical groups that had no more than a two percentage point increase or decrease between each consecutive year (negative two percent to positive two percent).
- Consistently declined: Medical groups with more than a two percentage point decrease between each consecutive year.
- Variable performance (with an improvement or with a decline): Medical groups with an up/down pattern that was not consistent and did not fall into one of the other categories.

Appendix 3: Medical Group and Clinic Performance Rate Tables

This section includes detailed tables per measure. The following elements are included in each table:

- The medical group/clinic name in order of high rate to low rate.
- The total number of patients in the denominator for each measure (N).
- The medical group/clinic's overall rate for each measure in their MHCP population.
- The lower and upper bounds of the 95 percent confidence interval.
- A rating that categorizes each medical group/clinic's performance. An **"Above Average"** rating is for medical groups/clinics that have an average and confidence interval that is fully above the overall medical group/clinic average for MHCP patients. An **"Average"** rating is for medical groups/clinics that have a confidence interval that includes the overall medical group/clinic average for MHCP patients. A **"Below Average"** rating is for medical groups/clinics that have an average and confidence interval that is fully below the overall medical group/clinic average for MHCP patients.

Appendix 4: Medical Group Performance over Time (Three Years)

Medical Group Performance over Time (Three Years)

As previously noted, the analysis of medical group performance over the past three years was done to determine patterns of medical group performance per measure over time. The reporting years of 2015, 2016 and 2017 were reviewed.

Our analysis looked for patterns in rate changes over these reporting years. Only medical groups with rates for all three years per measure were included. The time period of three reporting years was chosen to allow as many medical groups as possible to have the opportunity to be included in the analysis. The percent and number of medical groups were reported for each of the following patterns of rate changes over the past three years for each measure:

- High performance and above average rates: Medical groups with a rate and confidence interval greater than the statewide MHCP average for each of the three years.
- Consistently improved: Medical groups with more than a two percentage point increase between each consecutive year.
- Relatively stable: Medical groups that had no more than a two percentage point increase or decrease between each consecutive year (-2 percent to +2 percent).
- Consistently declined: Medical groups with more than a two percentage point decrease between each consecutive year.
- Variable performance (with an improvement or with a decline): Medical groups with an up/down pattern that was not consistent and did not fall into one of the other categories.

Table 26: Controlling High Blood Pressure – Rate Changes for Reporting Years 2015 to 2017

Appendix 5: Purchaser Performance Rate Differences

Statistical Methods of Analysis of Purchaser Performance Rate Differences

An analysis was conducted to assess whether a gap between purchasers within a medical group was present and, if so, whether that gap was statistically significant. Medical groups were included in the analysis if both purchaser categories (MHCP and Other Purchasers) met the minimum reporting requirements for a measure. In other words, for administrative measures, a medical group was included in the analysis if each purchaser category had at least 30 patients; and for hybrid measures, a medical group was included if each purchaser category had at least 60 patients.

Assessment was made at the clinic level for the DDS measures (Optimal Diabetes Care, Optimal Vascular Care, Depression Remission at Six Months, Optimal Asthma Control – Children Ages 5-17, Optimal Asthma Control – Adults Ages 18-50 and Colorectal Cancer Screening). For these measures, a clinic was included in the analysis if each purchaser category had at least 30 patients. The t-test was used to determine if gaps found between purchasers at the clinic level were statistically significant. The p-value of less than 0.05 included in this report is unadjusted for multiple test differences.

A second analysis was conducted examining the 95 percent confidence interval around the rate for medical groups/clinics and comparing it to the 95 percent confidence interval around the statewide rate. It was determined whether medical groups/clinics had a rate and confidence interval that fell outside the statewide confidence interval and had a purchaser gap that was significantly different from the statewide purchaser gap. Significance was designated at a p-value less than 0.05.

Childhood Immunization Status (Combo 10)

Ten medical groups met the minimum reporting requirement of at least 60 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level was 23 percentage points and is statistically significant. This means that the Childhood Immunization medical group rate for MHCP patients (39 percent) was significantly lower than that of Other Purchasers (61 percent).

All medical groups had a MHCP rate that was lower than Other Purchasers; eight of those groups had a statistically significant gap between purchasers.

We also assessed whether the gap between purchasers at a medical group level was significantly different than the gap found at the statewide level. For the Childhood Immunization measure, three medical groups had a gap between purchasers that was significantly different than the gap for the statewide rate and the gap was larger for two medical groups. However, for one medical group, the gap was significantly smaller. (See Table 33, Column 6)

There were no medical groups that had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 33 summarizes these findings.

Table 33: Statistical Analysis Summary of Purchaser Performance Rate Gaps – Childhood Immunization Status (Combo 10)

Clinic Level	MHCP Rate	Other Purchasers Rate	Percentage Point Rate Differences (Other-MHCP)	There is a significant gap within the clinic between purchasers.	There are significant differences between the statewide gap and the clinic gap
Statewide	38.7%	61.2%	22.5%	Y	
Allina Health	46.7%	68.0%	21.3%	Y	.
CentraCare Health	52.7%	64.6%	11.9%	.	.
Children's Clinic Network	18.9%	75.6%	56.7%	Y	>
Essentia Health	31.0%	65.0%	34.0%	Y	.
Fairview Medical Group	21.1%	59.0%	37.9%	Y	>
HealthEast Clinics	58.8%	61.1%	2.3%	.	<
HealthPartners Clinics	55.8%	75.0%	19.2%	Y	.
Park Nicollet Health Services	31.4%	64.5%	33.1%	Y	.
Sanford Health - Fargo Region	25.5%	38.0%	12.5%	Y	.
Sanford Health - Sioux Falls Region	55.8%	77.7%	22.0%	Y	.

Y = Yes, statistical significance
 < = Significantly smaller purchaser gap within Medical Group than the statewide gap
 > = Significantly larger purchaser gap within Medical Group than the statewide gap

Controlling High Blood Pressure

Fifteen medical groups met the minimum reporting requirement of at least 60 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level was six percentage points and is statistically significant. This means that the Controlling High Blood Pressure medical group rate for MHCP patients (72 percent) was significantly lower than that of Other Purchasers (78 percent).

Of the 15 medical groups, ten of them had rates for MHCP patients that were lower than Other Purchasers; four of these medical groups' rate differences were statistically significant. (See Table 34, Column 5) Five medical groups had higher rates for MHCP patients than Other Purchasers and this was statistically significant for two medical groups (See Column 4).

We also assessed whether the gap between purchasers at a medical group level was significantly different than the gap found at the statewide level. For the Controlling High Blood Pressure measure, three medical groups had a purchaser gap that was significantly different than the statewide gap. Three medical groups had a gap that was larger than the statewide gap (See Column 6).

There were no medical groups that had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 34 summarizes these findings.

Table 34: Statistical Analysis Summary of Purchaser Performance Rate Gaps – Controlling High Blood Pressure

Clinic Level	MHCP Rate	Other Purchasers Rate	Percentage Point Rate Differences (Other-MHCP)	There is a significant gap within the clinic between purchasers.	There are significant differences between the statewide gap and the clinic gap

 > = Significantly larger purchaser gap within Medical Group than the statewide gap

Colorectal Cancer Screening

Five hundred and thirty-one clinics met the minimum reporting requirement of at least 30 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level is 19 percentage points and is statistically significant. This means the Colorectal Cancer Screening statewide rate for MHCP patients (56 percent) was significantly lower than that of Other Purchasers (75 percent).

Of those 531 clinics, five hundred and thirteen clinics had rates for MHCP patients that were lower than Other Purchasers, of these 408 clinics had statistically significant differences. Eighteen clinics had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Table 35, Column 4); however, none of these clinics had MHCP patients with significantly higher performance rates.

We also assessed whether the gap between purchasers at a clinic level was significantly different than the gap found at the statewide level. For colorectal cancer screening, 141 clinics had purchaser gaps that were significantly different than the statewide gap. Twelve clinics had a gap significantly larger than the statewide gap, and 129 clinics had a rate significantly smaller than the statewide gap. Seventeen of those 129 clinics had a MHCP performance rate higher than the Other Purchaser rate. (See column 6)

The **eleven clinics** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 35 summarizes these findings.

- **Cromwell Medical Clinic, PLLC**
- **EH Central Crosslake Clinic**
- **HCMC Clinics - Golden Valley Clinic**
- **Mayo Clinic Health System New Richland**

Chlamydia Screening in Women

Seventy medical groups met the minimum reporting requirement of at least 30 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level was negative seven percentage points and is statistically significant. The sign is negative; however, which means the Chlamydia Screening medical group rate for MHCP patients (57 percent) was significantly higher than that of Other Purchasers (51 percent).

Sixteen medical groups had rates for MHCP patients that were lower than Other Purchasers; 54 medical groups had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Table 36, Column 4). Of those 54 groups, 20 had a statistically significant gap between purchasers. (See Column 5)

We also assessed whether the gap between purchasers at a medical group level was significantly different than the gap found at the statewide level. For the Chlamydia Screening measure, eleven medical groups had purchaser gaps that were significantly different than the statewide gap. Of these eleven medical groups, four had a gap significantly smaller than the statewide gap; seven had a higher MHCP performance rate than Other Purchasers. (See Column 6)

One medical group, listed below, had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 36 summarizes these findings.

- **Allina Health**

Depression Remission at Six Months

Two hundred sixty-six clinics met the minimum reporting requirement of at least 30 patients per purchaser group for this analysis. The purchaser performance rate gap at the statewide level was four percentage points and is statistically significant. This means that the Depression Remission at Six Months statewide rate for MHCP patients (five percent) was significantly lower than that of Other Purchasers (nine percent).

Of the 266 clinics, 211 of them had rates for MHCP patients that were lower than Other Purchaser patients; 23 of those clinics had a significant gap between purchasers. (See Table 37, Column 5) This means that these clinics had a significantly lower MHCP performance rate compared to Other Purchasers. Fifty-four clinics had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Column 4), with one clinic that had a significantly higher MHCP performance rate compared to Other Purchasers.

We also assessed whether the gap between purchasers at a clinic level was significantly different than the gap at the statewide level. Ten clinics had a larger purchaser gap than the gap at the statewide level; eighteen clinics had a smaller purchaser gap than the gap at the statewide level. (See Column 6)

The **eight clinics** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchaser patients, a MHCP rate higher than the statewide MHCP average and a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 37 summarizes these findings.

Appropriate Treatment for Children with URI

Sixty medical groups met the minimum reporting requirement of at least 30 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level is negative three percentage points and is statistically significant. The sign is negative; however, which means the Appropriate Treatment for Children with URI medical group rate for MHCP patients (93 percent) was significantly higher than that of Other Purchasers (90 percent).

Fifteen medical groups had rate gaps of less than one percent suggesting little or no difference between MHCP and Other Purchaser patients. Seventeen medical groups had rates for MHCP patients that were lower than Other Purchasers, and one of those medical groups had a significantly lower MHCP rate compared to Other Purchaser rate. (See Table 38, Column 5) Forty-two medical groups had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Column 4).

We also assessed whether the gap between purchasers at a medical group level was significantly different than the gap found at the statewide level. For the Appropriate Treatment for Children with URI measure, 11 medical groups had purchaser gaps that were significantly different than the statewide gap. Eight of those medical groups had a gap that was significantly larger than the statewide gap, while three had a gap significantly smaller than the statewide gap. For six medical groups, their MHCP performance rate was lower than Other Purchasers rate. (See Column 6)

The **two medical groups** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 38 summarizes these findings.

 > = Significantly larger purchaser gap within Medical Group than the statewide gap

Breast Cancer Screening

Sixty medical groups met the minimum reporting requirement of at least 30 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level was about 20 percentage points and is statistically significant. This means that the Breast Cancer Screening medical group rate for MHCP patients (63 percent) was significantly lower than that of Other Purchasers (83 percent).

Fifty-eight of the medical groups had rates for MHCP patients that were lower than Other Purchasers; 41 of these medical groups had statistically significant gaps between purchasers within the medical group. (See Table 39, Column 5). Two medical groups had a rate that was higher for MHCP patients than Other Purchasers (designated with a negative sign in Column 4).

We also assessed whether the gap between purchasers at a medical group level was significantly different than the gap at the statewide level. For Breast Cancer Screening, twenty-four medical groups had a gap significantly smaller than the statewide gap. (See column 6)

The **two medical groups** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 39 summarizes these findings.

- **Multicare Associates of the Twin Cities**
- **Raiter Clinic, LTD - IHN**

 > = Significantly larger purchaser gap within Medical Group than the statewide gap

Optimal Diabetes Care

Three hundred and sixty-eight clinics met the minimum reporting requirement of at least 30 patients per purchaser group for this analysis. The purchaser performance rate gap at the statewide level was 15 percentage points and is statistically significant. This means the Optimal Diabetes Care statewide rate for MHCP patients (33 percent) was significantly lower than that of Other Purchasers (48 percent).

Of those 368 clinics, 344 had rates for MHCP patients that were lower than Other Purchasers; and of those clinics, 194 had significant gaps between purchasers. (See Table 40, Column 5) This means that 194 clinics had significantly lower performance rates compared to Other Purchasers. Of the 368 clinics, 24 had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Column 4) and two of those clinics had a difference that was statistically significant.

We also assessed whether the value of the gap between purchasers at a clinic level was significantly different than the gap at the statewide level. Ten clinics had a significantly larger purchaser gap than the statewide gap; 57 clinics had a significantly smaller purchaser gap than the statewide gap. And of those 57 clinics, 22 had a MHCP rate that was higher than its Other Purchasers rate. (See Column 6)

The **12 clinics** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 40 summarizes these findings.

Optimal Asthma Control – Adults Ages 18-50

Three hundred and thirteen clinics met the minimum reporting requirement of at least 30 patients per purchaser for this analysis. The purchaser performance rate gap at the statewide level is 13 percentage points and is statistically significant. This means the Optimal Asthma Control statewide rate for MHCP adult patients ages 18-50 (40 percent) was significantly lower than that of Other Purchasers (53 percent).

Two hundred and sixty-six clinics had rates for MHCP patients that were lower than Other Purchasers; 103 of those clinics had MHCP patients with significantly lower performance rates compared to Other Purchasers. Forty-four clinics had rates for MHCP adult patients ages 18-50 that were higher than Other Purchasers (designated with negative signs in Table 41, Column 4); however, only one of these clinics had MHCP patients with significantly higher performance rates.

We also assessed whether the gap between purchasers at a clinic level was significantly different than the gap found at the statewide level. For the Optimal Asthma Control – Adults Ages 18-50 measure, 68 clinics had purchaser gaps that were significantly different than the statewide gap. Nine clinics had a gap significantly bigger than the statewide gap, and 59 clinics had a rate significantly smaller than the statewide gap. 31 of those 68 clinics had a MHCP performance rate higher than the Other Purchaser rate. (See column 6)

The **eleven clinics** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 41 summarizes these findings.

Optimal Vascular Care

One hundred and seventy-nine clinics met the minimum reporting requirement of at least 30 patients per purchaser group for this analysis. The purchaser performance rate gap at the statewide level was 19 percentage points and is statistically significant. This means that the Optimal Vascular Care statewide rate for MHCP patients (45 percent) was significantly lower than that of Other Purchasers (64 percent).

One hundred and sixty-five of those clinics had rates for MHCP patients that were lower than Other Purchasers; of those clinics, 97 had significant gaps between purchasers. (See Table 42, Column 5) This means 97 clinics had significantly lower performance rates compared to Other Purchasers. Of the 179 clinics, fourteen had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Column 4). None of the fourteen clinics had a significantly higher performance rate compared to Other Purchasers.

We also assessed whether the value of the gap between purchasers at a clinic level was significantly different than the gap at the statewide level. Four of the clinics had a significantly larger purchaser gap than the statewide gap; 23 clinics had a significantly smaller purchaser gap than the statewide gap. Of those 23 clinics, fourteen had a MHCP rate that was higher than their Other Purchasers rate. (See Column 6)

The **eight clinics** listed below in alphabetical order had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 42 summarizes these findings.

Optimal Asthma Control – Children Ages 5-17

One hundred and seventy-five clinics met the minimum reporting requirement of at least 30 patients per purchaser group for this analysis. The purchaser performance rate gap at the statewide level was 10 percentage points and is statistically significant. This means that the Optimal Asthma Control statewide rate for MHCP children ages 5-17 (51 percent) was significantly lower than that of Other Purchasers (61 percent).

One hundred and thirty-two of those clinics had rates for MHCP patients that were lower than Other Purchasers; of those clinics, 35 had significant gaps between purchasers. (See Table 43, Column 5) That means 35 clinics had significantly lower performance rates compared to Other Purchasers. Of those 175 clinics, 43 had rates for MHCP patients that were higher than Other Purchasers (designated with negative signs in Column 4), with three clinics that had significant gaps between purchasers. Also of those 175 clinics, one clinic had a rate of zero percent for both their MHCP patients and Other Purchaser patients.

We also assessed whether the value of the gap between purchasers at a clinic level was significantly different than the gap at the statewide level. Two clinics had a significantly larger purchaser gap than the statewide gap, while twenty-five clinics had a significantly smaller purchaser gap than the statewide gap. Of those twenty-five clinics, twenty had a MHCP rate that was higher than its Other Purchasers rate. (See Column 6)

The **eight clinics** listed below had a higher rate for MHCP patients compared to Other Purchasers, a MHCP rate higher than the statewide MHCP average and had a purchaser rate gap that was significantly lower than that found for the statewide purchaser rate gap. Table 43 summarizes these findings.

Appendix 6: Glossary

Attributed patient for measures collected by health plans (administrative and hybrid) – A patient assigned, or attributed, to a medical group for measurement purposes when the patient had one or more visits to that medical group during the measurement year. If a patient visited more than one medical group during the measurement year, the patient was attributed to the clinic at which he/she was seen the greatest number of times. If the number of visits to two different medical groups was the same, the patient was attributed to the medical group he/she visited most recently. An example of an unattributed patient could be someone a health plan identified using pharmacy data. Since this patient did not visit a medical group during the measurement year, he/she could not be assigned to a medical group during the attribution process. The federal Tax Identification Number is used as the common identifier for aggregating files across all health plans.

Attributed patient for measures collected by Direct Data Submission (DDS) – Medical groups must attribute each patient to a single clinic within their medical group. Each medical group's patient attribution method is defined by the medical group and is then reviewed by MNMCM as part of the denominator certification process.

Benchmarks – The benchmarks (standards used for comparisons) include the 2017 national commercial HEDIS rate and the 2017 national Medicaid HEDIS rate. The benchmark HEDIS rate is a national average of more than 90 percent of managed health care plans and some PPO health plans that submit data to NCQA to measure performance against a detailed set of measure criteria. Benchmarks were included in this report for measures with a comparable national Medicaid HEDIS rate (Appropriate Treatment for Children with URI, Childhood Immunization Status (Combo 10), and Chlamydia Screening in Women).

Clinic – Any location where primary or specialty care ambulatory services are provided for a fee by one or more physicians.

Direct Data Submission (DDS) measures – Measures collected using the DDS process, which include Optimal Diabetes Care, Optimal Vascular Care, Depression Remission at Six Months, Optimal Asthma Control – Children Ages 5-17, Optimal Asthma Control – Adults Ages 18-50 and Colorectal Cancer Screening. The results of these measures are calculated using data submitted by medical groups/clinics. These data come from electronic health records or paper-based medical charts.

Dual eligibles – Patients who were enrolled in both Medicare and Minnesota State Public programs.

Healthcare Effectiveness Data and Information Set (HEDIS) measures – HEDIS measures, produced by NCQA, are a set of standardized, quantifiable measures designed to allow reliable comparisons of the performance of insurers and care providers across a broad range of important health issues. HEDIS measures include: Appropriate Treatment for Children with URI, Childhood Immunization Status (Combo 10), Controlling High Blood Pressure, Breast Cancer Screening and Chlamydia Screening in Women. The data for these measures come from health plan claims and/or medical record review. Health plan files are aggregated and then results are reported at the medical group level.

Institute for Clinical Systems Improvement (ICSI) – ICSI is an independent collaborative that helps its members provide evidence-based health care services to patients. Comprised of approximately 50 medical groups and sponsored by three Minnesota nonprofit health plans, ICSI unites diverse stakeholders to deliver patient-centered and value-driven care in Minnesota and surrounding areas.

Measure categories – MNMCM combines measures into the following categories to summarize medical group/clinic performance:

- **Measure Specification Changes since 2016** – Measures in this category had specification changes in the previous year. Due to this, no trend data is available.
- **“Large Increase” and “Large Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was greater than or equal to five percentage points from 2016 to 2017.
- **“Moderate Increase” and “Moderate Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was greater than or equal to one percentage point and less than or equal to five percentage points from 2016 to 2017.
- **“Small Increase” and “Small Decrease”** – These categories include measures that displayed a MHCP rate change whose absolute value was less than or equal to one percentage point from 2016 to 2017.

Medical group – One or more clinic sites operated by a single organization.

Minnesota Health Care Programs (MHCP) – These health care programs (i.e., Medical Assistance including dual eligibles and MinnesotaCare) provide service under both fee-for-service and managed care delivery systems purchased by DHS. This report only includes performance rates for the managed care programs (i.e., Medical Assistance including dual eligibles and MinnesotaCare).

MHCP medical group average – This represents the average performance of all medical groups for patients covered by MHCP. The MHCP medical group average includes *only* those MHCP patients who were attributed to medical groups. Some medical groups meet the minimum threshold necessary for MNMCM to report their performance and others do not; however all of their data are included in calculating this average. This rate is the most appropriate average to use on the graphs that compare a single medical group with the performance of all medical groups. The medical group average tends to be slightly higher than the MHCP statewide average because it includes patients who accessed care within the measurement year. MHCP medical group averages are only used on charts that compare medical groups.

MHCP statewide average – This represents the average performance rate at the statewide level for all MHCP patients. MHCP statewide averages include patients who were attributed to a medical group *and* patients who were not attributed to a medical group.

MN Community Measurement (MNCM) – MNCM is an independent, community- based, non-profit organization dedicated to accelerating the improvement of health in Minnesota and surrounding communities through measurement and public reporting of health care performance. For more information, please visit mncm.org.

National Committee for Quality Assurance (NCQA) – A national non-profit organization dedicated to improving health care quality. NCQA accredits and certifies a wide range of health care organizations, as well as produces HEDIS measures.

Other Purchasers – This includes commercial (employer-based insurance coverage) and Medicare managed care data (excluding dual eligibles insured through MHCP). It also includes health plan data from commercial HMO/POS and some PPO products, plus Medicare Cost and Medicare Advantage.

Statistical significance - The significance level is the principle used for rejecting the null hypothesis (e.g. the difference between a medical group rate and the statewide rate occurred by chance). To test this hypothesis, the difference between the findings of the study and the null hypothesis is calculated. With the assumption that the null hypothesis is true, the probability of the difference is determined and compared to the significance level (in this report, the significance level is defined as $p < 0.05$). If the probability is less than the significance level, then the null hypothesis is rejected and the outcome is said to be statistically significant.

Self-Paid – Patients who pay for their own health care services.

Statewide rates – This includes patients meeting measurement criteria enrolled in managed care health plans including commercial, Medicaid managed care and Medicare managed care.

Appendix 7: Measure Definitions

Measures with Specification Changes in 2017

- Childhood Immunization Status (Combo 10) – Measures the percentage of children two years of age who had four diphtheria, tetanus and acellular pertussis (DTaP); three polio (IPV); one measles, mumps and rubella (MMR); three H influenza type B (HiB); three hepatitis B (HepB), one chicken pox (VZV); four pneumococcal conjugate (PCV); one hepatitis A (HepA); two or three rotavirus (RV); and two influenza (flu) vaccines by their second birthday.

Increase in MHCP Rate Measures

Moderate Increase

- Controlling High Blood Pressure – Measures the percentage of patients ages 18-85 with a diagnosis of hypertension whose blood pressure was adequately controlled at: (1) Patients ages 18-59 whose blood pressure was <140/90 mm Hg, (2) Patients ages 60-85 with a diagnosis of diabetes whose blood pressure was <140/90 mm Hg or (3) Patients ages 60-85 without a diagnosis of diabetes whose blood pressure was <150/90 mm Hg. The representative blood pressure is the most recent blood pressure reading during the measurement year (as long as the reading occurred after the diagnosis of hypertension was made).

Small Increase

- Colorectal Cancer Screening – Measures the percentage of adults ages 51-75 who had appropriate screening for colorectal cancer screenings.

Decrease in MHCP Rate Measures

Small Decrease

- Chlamydia Screening in Women – Measures the percentage of sexually active women ages 16-24 who had at least one test for Chlamydia infection during the measurement year.
- Depression Remission at Six Months – Measures the percentage of patients whose PHQ-9 score is less than five at six months after their initial score was documented, which is the definition of remission. It's based on the denominator of patients with a diagnosis of major depression or dysthymia whose initial PHQ-9 score is greater than nine.
- Appropriate Treatment for Children with Upper Respiratory Infection (URI) – Measures the percentage of children ages three months to 18 years with a diagnosis of URI who were not given an antibiotic prescription within three days of the episode period (July 1 of prior year to June 30 of measurement year). A higher rate represents better performance.
- Breast Cancer Screening – Measures the percentage of women ages 50-74 who had a mammogram during the measurement year or prior year. The Breast Cancer Screening measure had revisions to its age criterion in 2014. The age criterion for previous years included ages 50-69.

Moderate Decrease

- Optimal Diabetes Care – Measures the percentage of patients with diabetes (Types 1 and 2) ages 18-75 who reached all five treatment goals to reduce the risk of cardiovascular disease. The treatment goals include hemoglobin A1c (A1c) less than 8, blood pressure less than 140/90 mmHg, on a statin medication unless allowed contraindications or exceptions are present, daily aspirin use if they have a co-morbidity of Ischemic Vascular Disease (IVD), and documented tobacco-free status. In 2015, the measure was a four-component composite measure without the statin use component.

- Optimal Asthma Control – Children Ages 5-17 – Measures the percentage of patients ages 5-17 with persistent asthma who have reached all of the following two targets to control their asthma: (1) evidence of well controlled asthma and (2) not at risk for elevated exacerbation as evidenced by no patient-reported emergency department visits and hospitalizations.

Large Decrease

- Optimal Vascular Care – Measures the percentage of patients with vascular disease ages 18-75 who reached all three treatment goals to reduce modifiable risk factors. The treatment goals include blood pressure less than 140/90, on a statin medication unless allowed contraindications or exceptions are present, daily aspirin use, and documented tobacco-free status.
In 2015, the measure specification included an LDL component of LDL-C less than 100 mg/dl.
- Optimal Asthma Control – Adults Ages 18-50 - Measures the percentage of patients ages 18-50 with persistent asthma who have reached all of the following two targets to control their asthma: (1) evidence of well controlled asthma and (2) not at risk for elevated exacerbation as evidenced by no patient-reported emergency department visits and hospitalizations.
